So did I....

I just joined the communications posse and will be going through the usual classes (law and legal, first aid). As a blind person, I will also be the first to be working for a county sheriff anywhere in the nation. It is going to prove to be an interesting experience. Dan Ford is still the C.O. of the communications posse and will probably continue in that position for a number of years yet.

I, personally, will probably be working with the mobile command post (or some other similar communications position) very soon. I hope it will be enlightening....

Hello all,
I need some information on how to add a signal strength meter to my
Radio shack pro-2022 programmable scanner. I have the tech manual for
this machine and would need to know what parts, etc to connect and
what meter would be recommended...

Any reasonable help would be appreciated...

Eric <n7zzt@goodnet.com>

I have a AR-1000 too. It is very user-un-friendly but works well and gets all the frequencies up to 1.3 Gig. Please post an address where I can get another one or get repairs. I need a new touch pad and the battery charging system needs to be replaced, including the plug. Thanks.

In regards to this individuals last 5 messages posted in this group...

I'm not sure what irks me more, the nuisance flaming that obviously won't do any good, or the fact that this individual cannot spell worth beans.

It seems to me, Mr BCheek4540 from AOL, that you seem to be posting just to post something. These past 5 messages only show your ignorrance.
They SAY nothing worthwhile, therefore they MEAN nothing worthwhile.

Leave this type of stuff on your side of the modem and quit pestering those of us who try to use this group for what it was intended.

Have a good day
Roger

Jeremy,

You might want to check out this URL for Radio Shack scanners.

http://www.zianet.com/kc5kto/mods.html

This page has links to most (if not all) Radio Shack scanners with tip
and mods available for each.

Most scanners can monitor analog trunked system as long as it has the
frequency range for that particular system. I have not heard of any
scanners that are capable of monitoring digital systems.

From: cheshire@ridgecrest.ca.us
Message-ID: <DvHCpE.3r1@ridgecrest.ca.us>
Source record: 227853
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have a computer controlled pro-2006, and a pro-2030, as well
as several hand held and mobile scanners. I ALSO have 3 or 4
old Regency crystal controlled scanners. WHY would anyone
want something as archaic as a non-programmable, crystal controlled
scanner? I live in a small town where the cop-shop uses only one
or two frequencies. Each of these old scanners have only one or two
frequencies in them, but are *on* 24 hours per day in various rooms!
If I hear some action, I go to my office and tune in to the rest of
the frequencies. The main reason I can keep several of them going
all the time is that they are *cheap* ! donjajusloveit?

Message-ID: <19960801181751.aaaa003ke@babyblue.cs.yale.edu>
Source record: 227854

I see an article in the August US Scanner News about modifying the Pro-2030 scanner that was recently closed out at Radio Shack. I assume the modification was for full 800 MHz.

My PD is about to go Trunking, so I wanted to pick up a cheap one just for that purpose. If it can get full 800, great!

I don't see it in this year's catalog, how long ago did they put it on $89 closeout? Does anyone have a Radio Shack part number (I know it's not Pro-2030 for the smart alecs out there!), I'd like to see if I can get one. It sounds like a good deal.

Thanks to those who have replied both to the group and via e-mail. The MedFlight I am referring to has helos based in Columbus, Coshocton, and Wellston, Ohio. They were formed by a merger between Grant LifeFlight and Columbus Skymed. I am looking for their helo to base freqs other than 155.400 which they may have stopped using.

Thanks again,

Steve

20. Re: OS456 or CE232

Newsgroup: rec.radio.scanner
Date: 1996-08-01 00:00:00 UTC
From: Ultrix <ultrix@aimnet.com>
Message-ID: <3201837B.579A@aimnet.com>
Source record: 227864

Thank you for the reply.... Here are the conclusions that I have
come to on the two devices.

> The OS456 replaces the scanner's CPU. The CE-232 works as a robot,
> not only for control of the scanner, but also for data collection from
> it. The CE-232 does not replace or interfere with the scanner's CPU,
> nor does it replace anything else in the scanner. The CE-232 is
> strictly bolt-on. I don't believe the OS456 uses the scanner's
> memory, either. The CE-232 does. The CE-232 does not alter any
> aspect of the scanner's performance or functionality.
> OS456 - It is kind of unfortunate that the OS456 does not
automatically program the scanners memory. However
the fact that it replaces the scanners CPU is a plus,
this should mean that OptoScan did this to take better
advantage of the scanner's lower level control functions.

CE232 - It is a plus that it autoprograms the scanners memory.
The unused I/O bits are a definite plus and allows good
flexibility with add on equipment/projects. However, the
fact that it is a "robot" means that no new low level
functions of my scanner can be exploited. My scanner is
the same as it ever was, just a different entity pushing
the buttons and watching the display for me.

> That's arguable with no clear-cut winner. The two are different
> products that actually can compliment each other with very little in
> the way of toe-stomping. The OS456 may be handicapped if the scanner
> is operated away from the computer. You can connect and disconnect
> the CE-232 all day long and not impact the scanner. The CE-232 is
> installed in a "parallel" manner with the scanner, whereas the OS456
> is aptly a series insertion device.
> From my preliminary info, I agree with that. It does look as
if the devices might actually be able to compliment each other, however
from my understanding (this may be wrong...) but don't both devices
require an RS-232 port from my computer? That would be very
inconvienent since three of my four available serial ports are already
in use, and most computers only have 2 serial ports (1 of which is usually
used by a mouse....).

I don't really understand the above paragraph, are you saying that
the CE-232 will continue to work even if it is not connected to a computer.
What will it do? It can't autoprogram can it? Doesn't it need an ASCII
file to be sent to it from a computer to do that? Do the Input/Output ports
continue to collect data? If so how much data can it store, and if they do
not wouldn't you still end up with just a stock scanner just like you do

when you disconnect the OS456 from the computer?

> For the PRO-2004/5/6, the CE-232 is a 2-way interface; collects data
> from the scanner and send it to the PC for display and processing as
> desired. Also controls the scanner and AutoProgram's the scanner's
> memory channels from a plain ASCII text file.
>

OS456 - Can't the OS456 can do this also? (except the autoprogram of the
scanners memory) it stores the channels in the computer and then
sets the scanners frequency accordingly, and at a higher scan rate
then the stock scanner is capable of.

CE232 - All of the features listed above (including autoprogramming...).
But no scan speed improvements. Also, does the CE232 change
the scanners freq on the fly??? Or does it have to program it
into memory first and then set the scanner to the corresponding
channel?

> The OS456 replaces the CPU altogether, but it cannot AutoProgram the
> scanner's memory. Aside from that, it's pretty open-ended as I
> understand it. The OS-456 has to go with the one scanner where ever
> it goes. One CE-232 can be used with a variety of scanners, first
> one, then another, then another, etc.
> CE232 - Flexible.

OS456 - Doomed to stay in 2006.

> Collects display data from the serial data line between the CPU and
> the LCD Display driver. All data that appears in the scanner's LCD
> display is available to the PC for a variety of storage and
> processing. Control and AutoProgramming are done by what I call

> switches of most any sort. Output bits are set by logic
> decision-making based on most any criteria desired by the user.
>

Well, thanks for the info. Both the CE232 and the OS456 have
their strong and weak points. However I believe that the OS456 has
stronger features and better engineering then the CE232. The CE232
sounds like just your standard I/O board with its I/O lines connected
in parallel with the keyboard and LCD connectors and a Motorola
microcontroller acting as an RS2343 transceiver for talking to the
computer. I already have a couple of home-brewed boards (Using PIC16C74
microcontrollers instead of the older Motorola.) that I use for data

collection on my projects.

If you where to decide that you wanted to improve upon the CE232,
I would recommend using the PIC Microcontroller specifically the PIC16C74,
this chip will still give you the same I/O capability but also with the
capability to change one IO port into an 8 channel A/D converter. This
could be used to give the board S-Meter, and possibly even DTMF and CTSS
tone decoding capability. You can also set this chip up to have a fully
functional serial interface to make the interface to the computer more
easily and with less hardware.

Well, thank you for your time.... After reviewing the facts I
am looking more torwards the OS456. Best regards.

Ultrix@aimnet.com

Be even easier to just build an anteanna. I prefer j-pole and simple
ground planes for omni-direction. It is also very easy to build a
cheap three or four element beam for a scanner.

If you would like to know how to build an anteanna that would work
better than a tv anteanna, I can give you some designs I have made.

On the other hand, a tv anteanna on its side may work, but I do not
think it will do very well.

Good reading... that sounds intriguing! The two-way shop I work for is going to be installing radios in USPS short-haul trucks for the Pasadena, CA office. We'll be removing old Aerotrons and installing 4-channel VHF Vertex mobiles. Granted, the frequencies will only be 3000-odd miles useless, but they might give you a place to start. And I will of course probe for a more comprehensive list, "just for reference," of course, when I talk to whomever I do to get the info for the radios that we will be installing.

Stay tuned.

>Newsgroups: rec.radio.scanner
>From: yonnie@sltrib.com (Jon Van Allen)
>Subject: WANTED DEAD OR ALIVE- OLDER BEARCAT SCANNERS
>Date: Wed Feb 28 21:49:37 1996
>
>Wanted, your old Bearcat 210, 220, 20/20, 250, 300 or 350
>scanners, working or not. Any of these old classics still
>out there? Maybe just collecting dust? Let me know if you
>have one relegated to the junk heap. Post here or via email
>yonnie@sisna.com
>
>Thanks, Jon

Seems innocent enough. We corresponded by e-mail and I told him
I had two Bearcat 250s that I had been planning on fixing but
wasn't really sure I had the knowledge so thought I would sell
them. He said all he could offer "sight unseen" was $20 each.

To make a long story short, I sent them to him for evaluation with
the understanding that he would send me a check after he got a
chance to look at them. That was last April.

Here is the e-mail I received from him just before I sent the
scanners to him. Pretty smooth, isn't he!

>Thanks for the update. Your plan is fine with me, and I will give you a fair
>price once I have looked them over. I am an honest person, and you know
>Jack, I have not been burned yet dealing with people over the net on a basis
>of mutual honesty.
>
>I'll be glad to get them, thank you.

I have sent e-mails requesting my money on May10th, June 11th,
and July 14th and got no reponse from him.

We live and learn. Just felt an obligation to share this with you.

>May I suggest you try the following.

Suggestions are always great.....if they're safe and relevant.

>Start by checking grounds.

<Giggle> Ri--ght. But ok.....

>- make sure the ground from the engine to the firewall is ok

<Giggle> Easy enough to check. Easy enough to get misleading
results, too. DC grounds are not always equal to RF grounds. And is
he to think a 2-ft braid from the engine block to the firewall is a
good RF ground?

>- made sure the ground on the exhaust is ok

Ri--ght. Where? At the manifold? At the joint after the heat riser?
At the joint to the catalytic converter? Joint to the muffler? Or
the tailpipe?

>- antenna grounds

For a rubber duckie? Or an external antenna? If external, where?
What if it's a magnet mount?

>- radio

A PRO-51? You're pulling his leg, right?

>- battery to anything.

Which battery, the scanner's or the car's? What if he does or doesn't
power the scanner from its own battery or the car battery?

>- Power your scanner directly from the battery. This would
> eliminate a poor ground path.

How could it eliminate a "poor" RF ground path? A conductor over a
few inches is NOT an RF ground.....and therefore is always a poor
ground path. What's he to do about THAT?

Powering the scanner from its own battery is the BEST possible ground
path to power. :-))

>Noise is still their?.....

...."their"? Huh? You're in 'journalism', right?

>- clean the inside of you distributor cap with alcohol.
>- make sure the ignition wires (spark plug wires) are clean,
> not arcing anywhere making good contact to the sparkplug.

<Giggle> In a modern vehicle? He might be lucky to even SEE a spark plug cable and the distributor. This procedure is generally out of the capability of the "casual joe" and could be dangerous. Some folks can do all that, but not all.....

>TIP: you can test for a leaky cable at night with a water spray
>bottle. Spray a heavy mist and see if you see any sparking and if the
>noise changes.

And if there wasn't any sparking before, there will be. :-)

>- Ignition coil may be leaky, spray water around it also and look for
> change in noise or visible sparks.

Kaaaaaaaaaa---BLAMMMMMMMMMMM! 'Spose the poor fellow needs to drive to work the next day?

>Most of the time when I've fixed these problems for others I've
>wiggled wires and used a spray bottle. Most of the time it can be
>found this way.

Really now? Do tell, please..... Is this for go-karts?

>In the past when I installed radios into police cars we had to ADD
>ground straps to the trunk, hood etc.

Whew! For a minute there, I was beginning to worry about YOU and the other fellow. Ground straps are harmless......and might even help once in a while. Trouble is, you need braid for the flexibility, but braid sucks as an RF ground conductor; great for DC.....

>Let me know how you make out. Or if any of the above makes a change
>I may then be able to suggest further action.

Oh lordy..... <running for cover.....>

>Remember a car will generate electrical notice. It is normal to have
>some noise. Some radios are better then others at dealing with
>this.

Electrical or ignition? That's for all cars, but each differs as night and day. And then there's microprocessor noise, too, for newer vehicles. Electronic ignition systems can generate their own unique switching transient noise, quite apart from ignition noise. He needs to be able to tell the difference and avoid getting his dickskinners zapped.

>just trying to minimize it.
>Ron Katz
>News Cameraman

>Toronto Ontario
>http://www.interlog.com/~ronkatz/
>Your source of information for
>Scanning the Emergency Services and More.

Oh. My goodness.....

Well, one thing for sure is readily apparent. The foregoing of yours sure doesn't emanate from personal experience. Looks like it comes out of an old CB Radio book of the 1960's or so. If it is personal experience, then you either aren't up with the times, or you run a pro-shop. But if you ran a pro-shop, you'd have told the guy to go GET those things checked by pro's to ensure the quality of the tests and measurements. The casual joe doesn't have the wherewithal or the instruments to ENSURE most of the conditions to which you referred.

Yeah, Katzenjammer, it's nice to be pertinent; on-topic; and helpful, but it's even nicer to be explicit, to the point, and very relevant. Otherwise, people can be led astray to a needless waste of time, and sometimes to property damage, injury, or even death.

Vehicular Noise Suppression technology of the 60's is not all that applicable today, especially CB-goodbuddy stuff applied to VHF-UHF where there is a huge difference of techniques and technologies.

But hey, you were just showing me up, huh? :-))

Is this really true? I have never had the chance to play with one of the Uinden scanners with the optional tone board installed. All of my commercial radios and my ham rigs only mute the audio output when proper CTCSS tone is not present. I offten wished that the designers had tied the tone decode into scan/resume logic as well as the audio chain. I would think that the OPTO board in a PRO-2006 would let you do this as you have the flexibility of computer control. Anyone out there have a BC-760 or BC-9000 with the tone board in it? What does the CTCSS control scan functions or audio output?

No mods available for beartrackers. These are made after the laws
went into effect which made it illegal to manufacture a scanner which
is easily modifiable. And, I have not heard of anyone being able to
modify it.

Seems to work ok like it is anyway : without cellular.

Well it's still Life Flight (actually, Metro Life Flight) here in
Cleveland, and they are on 155.385. Based in Downtown Cleveland, with
two remote pads - one in Lodi, one in Solon. Great listening too (I
live in Solon!) They have 7 aircraft total.

Good reading... that sounds intriguing! The two-way shop I work for is going to be installing radios in USPS short-haul trucks for the Pasadena, CA office. We'll be removing old Aerotrons and installing 4-channel VHF Vertex mobiles. Granted, the frequencies will only be 3000-odd miles useless, but they might give you a place to start. And I will of course probe for a more comprehensive list, "just for reference," of course, when I talk to whomever I do to get the info for the radios that we will be installing.

Stay tuned.

I agree with you. I started reading this forum in hopes of getting tips on ready-built scanners, getting a bit tired of listening only to aviation traffic on a homebrew scanner. Now I'm getting tired of the constant HATE output of mackey, pjb, duff, etc., whose ONLY concern these past three weeks as been to mean-mouth yourself; their entire output has been nothing concerning radio communication of any kind, shape, or form.

It's a sad condition, but typical of the angry, frustrated individuals who sit behind the armor of their display screens and scream at others in apparent perfect personal safety. Ignoring them might cause them to go away...perhaps in months from now...but many others will have left out of irritation. Replying in kind is no better since this gets the angst-ridden the _attention_ they feel they deserve. "Taking it to e-mail" only results in a worse condition since they will only heap more curses on anyone in private who complains about their sacrosanct, divine opinions.

The only cessation possible is for the bullies, the verbal terrorists, to go elsewhere to practice their perverted form of "free speech." Pity those in that elsewhere who become the object of their hate.

Meanwhile, having been placed in at least one kill-file, I'm still looking at ads, massaging a personal budget, planning a better antenna installation...and using the <Enter> key a LOT. 73. :)

From: Bob Edris[SMTP:edris@USAFSAM.brooks.af.mil]
Sent: Thursday, August 01, 1996 12:48 PM
To: bcheek@cts.com
Subject: Pro43 Charger Voltage

> What is the maximum open circuit voltage for a charger for the PRO-43?

Factory stock? Well, you want to apply 1.44v (max) to each
NiCd cell, times 6 cells, for a total of 8.64v. Call it
8.60v for safety-sake. But that ain't the end of it.

There is a series diode in the recharge circuit in the scanner
that drops 0.6v no matter what, so add that in. Then there is
a series resistor of 22-ohms and two chokes of about 0.5-ohm each.
So resistive drops have to be added in, too. The sum of all the
voltages is what the maximum loaded terminal voltage of the
recharger should be, so let's calculate:

Pack needs to not exceed: 8.60v
Diode drop: (estimated) 0.60v Measure it, if you can!
Resistive drops:
Using the C/10 trickle
rate: mA/h rating of pack
divided by 10. Will
assume 600-mA/h cells:

Er = (Ir)(Rt)
= (0.060a)(22+.5 +.5)
= .06 x 23
= 1.38v
================
Recharger Supply (Max) 10.58v (DC) (at 60-mA drain)

When there is no current drain (open circuit), the terminal
voltage will rise, but itcannot be predicted to what, since the
internal resistance of each recharger will vary. It is best
to connect a variable resistor to the terminals with an
ammeter in series; adjust for 60-mA (or the C/10 rating) and
then measure the terminal voltage to ensure it does not
exceed the calculated limit. Then remove the resistor and see
what it rises to. But that would be the limit ONLY for that
recharger. Other rechargers would differ.

> I'm in the AF and go to several bases. I have a bunch of 9V wall
> warts and wanted to make up some so I wouln't have to drag the

> charger with me. If I'm correct, you need a certain amount of
> voltage above the total voltage of the nicad pack to get a "full"
> charge...??? I've read that there's a 20 ohm resistor in the charge
> circuit of the 43 to limit current...and I was wondering if there's a
> max open circuit voltage so that the resistor won't be fried???
> Reason I ask is that a couple of my 9V packs have open circuit
> voltage at 14+ volts.....(thought that was a little too much!)

Well, you got the right idea, all right. But the Eoc (Open Circuit Voltage) of the recharger is not your target so much as the loaded output when it is producing 60-mA or whatever the C/10 rating of your pack is. If it's a 1000-mA/h pack, then C/10 is 100-mA or 0.1-a.

Soooo, break one of the two wires from the recharger, and insert a milliammeter between the breaks. Connect a 250-1000 ohm potentiometer to the terminals at the end of the wire. Adjust the pot so you're drawing C/10 of current, and then measure the terminal voltage. If over the calculated limit, it will over charge the pack.

If you only have one meter, then remove the milliammeter, close the breaks in the wire, and set the meter to voltage to measure the recharger while it is still feeding the pot with C/10, see?

Of course, you have to repeat the calc's above if your C/10 differs from 60-mA. But it will lead you to a MAX trickle charge voltage of the recharger at its terminals.

It's the CALCULATED limit that requires your attention; not the open circuit voltage! If a recharger has a high internal resistance, then its open circuit voltage is meaningless.

This is to say that one wall adapter with 14v Eoc might be safer than another one with 12v Eoc. Soooooo, using the above information, you can CALCULATE additional dropping resistance to insert in the "breaks" of the recharger wire where we put the ammeter.....IF otherwise, the calculated limits are exceeded by the recharger.

Example: If the calculated limit above is 10.6v, but the recharger puts out 12v @ C/10 of 60-mA, then let's figure the additional series dropping resistor needed:

Needed: to drop 12v to 10.6v = 1.40v drop
Calc: R = E/I
= 1.4 / .06
= 23 ohms.

A 22-ohm resistor is common and would work fine for THAT recharger ONLY.

Howzzat?

Bill

I have 8 pages worth of MN Federal stuff over here. Try picking up a Police Call Directory or using the Search feature on your scanner it works great everytime. Good Luck.
There is a scanner club meeting coming up in October which will be held in Madison, WI. If you're interested, a bunch of us will be carpooling down and back in one day. ->Dan

51. REQUEST: Washington D.C. Area Frequencies

Newsgroup: rec.radio.scanner
Date: 1996-08-01 00:00:00 UTC
From: Gordon Arnold <garnold@scf.usc.edu>
Message-ID: <3201938D.7C75@scf.usc.edu>
Source record: 227895

I will be spending the fall of this year in the Washington D.C. area,
and was looking for a list (as comprehensive as possible) of good stuff
to listen to. This will be my first trip to the east coast, so I don't
have any idea what's out there. I will be living across the river in
Arlington, VA, and spending my days in the District.

I'm interested primarily in public safety frequencies, but utility and
other such services can never hurt.

Thanks in advance.

Gordon

>Any specific freq's to monitor?

Good reading... that sounds intriguing! The two-way shop I work for is going to be installing radios in USPS short-haul trucks for the Pasadena, CA office. We'll be removing old Aerotrons and installing 4-channel VHF Vertex mobiles. Granted, the frequencies will only be 3000-odd miles useless, but they might give you a place to start. And I will of course probe for a more comprehensive list, "just for reference," of course, when I talk to whomever I do to get the info for the radios that we will be installing.

Stay tuned.

53. Re: TRUNKED RADIO PROGRAMING

Newsgroup: rec.radio.scanner
Date: 1996-08-01 00:00:00 UTC
From: Gordon Arnold <garnold@scf.usc.edu>
Message-ID: <32019111.5329@scf.usc.edu>
Source record: 227897

It depends on what trunking protocol is being used. In the EF Johnson ClearChannel LTR system, radios do not have a unique ID. One pays the service provider on the honor system for the number of radios per talkgroup per subscriber.

In the Motorola Privacy Plus systems (there are two) radios do have a unique ID, and communications can take place by simply pressing the PTT and addressing all radios in the talkgroup, or by keying in a specific radio ID and holding a "private" (not heard by other users... scanners are a different story) conversation with only the unit or group hailed (it's all in the switch). I believe that the GE/Ericsson EDACS system is the same way.

Whether or not "cloning" cables exist is dependent on the manufacturer, and I imagine is only possible with the LTR system. As to whether you could pretend to be a real unit on a Motorola or GE/Ericsson trunked system, certainly, although I am not sure what the system would make of it when more it received more than one reply to status queries.

And to answer your first question, 800 and 900 MHz frequencies are designated by channel numbers, so one programming a trunked or conventional radio does not enter the frequenies but rather a three digit FCC assigned channel designation (such as 100, 323, you get the idea.) In the case of a LTR trunked system, these channels (up to 20, and try to think of them as the a variety of communcication paths so as not to confuse them with the talkgroups which act as channels would in a conventional system) are assigned slots in the system, so that when the controller tells radios in a given talkgroup to switch to repeater 20, for example, the radio knows what frequency repeater 20 is on, for example FCC channel 323.

I know that takes some getting used to, but trunking is pretty neat. Certainly better than multiple tone community repeaters.

57. Bill Cheek - FAQ and Mail Bombs

Newsgroup: rec.radio.scanner
Date: 1996-08-01 00:00:00 UTC
From: ronkatz@interlog.com
Message-ID: <32003158.8759383@news.interlog.com>
Source record: 227901

What is a mail bomb....

A mail bomb is when you send the same
material over and over again to the same person so that they are
flooded with e-mail and their computer gets tied up trying to
download all the junk mail just to read the real stuff.

How do I mail bomb someone?

Well your can send a large file to them over and over again, Or if its
large enough (1Meg =about 10min hang time) send it just once.

How would I get in trouble for doing this?

Your ISP may feel that your abusing their service and kick you off
their system.

Why do people complain about Bill.

Well, many have complained about his use of the newsgroups. The
newsgroups is for discussion of or related to radio and scanners.
Bill uses it to fight with others and uses language that many find
offensive.

Can he be kicked off?

NO, he has the right to express himself. There is no Internet Police
that will kick him off. Public pressure will. You are the Internet
Police. It is your job to tell someone that they are doing something
you do not agree with. But no one can force him to do anything.

Seems like Bill is getting mail bombed.
Will this get him to stop?

Yes and no. I don't recommend mail bombing him. I recommend that
you REPLY TO EVERYTHING HE POSTS. This will send the offensive
material back to him. You should add to it the reason you feel
it does not belong and that you wish him to stop.

This is not a mail bomb. What happens though is if you respond to 5 of his daily posts and lets say only 10 people around the world who read the newsgroups also do, that's 50 messages he gets.

This is not a mail bomb but will have the same effect.

He will over time get the message!

I'm really getting sick of this stuff and I don't think this belongs here!

Well, so am I. I can't stop him. If we ignore it then we are part of the problem. This is just one person. Could you imagine if it were a few people doing this? Take a few seconds and read the news group. Find the offensive Posts and respond to them. Remember, to keep it to private e-mail. If you respond to it by posting it to the news group then its will just invite others to get involved.

Its not a matter of a 'truce'

Its a problem with offensive language, public post that serve no purpose but to flame others and someone who is only doing it for a bit of fun.

Right now it is Bill agianst someone. Not everyone against everyone else. Its a problem with Bill. I don't even think he started this but he sure can fuel it..... He can just as easily stop it also.

Let get back to scanning, shall we?

Message-ID: <32000DDB.5B1A@No-where.com>
Source record: 227952

The subject says it all.

Quit writing to ISP's Bill. They are not as gull easily fooled
as some of the Fido ISP's you are used to.

Quit writing to us about you being in charge of your "domain". A
Fidonet Node or BBS is hardly to be considered a "domain". Besides,
it is giving people ideas. Already, I have heard of two people who
spoke to your provider by phone bitching about you.

Quit claiming you have dual masters degrees & the FCC commercial lic,
& teach ham classes. It's bullshit. You have some good knowledge &
should just rely on your basic knowledge/abilities. Don't try to
tell us all the other stuff because most of us know better.

Quit making up pissy little stories about people & pasting together
bogus messages about them. Only the most foolish of users are going
to believe it.

Quit trying to blame the bcheek@aol user on me. You know damm good &
well that I have access to enough anonymous servers that I don't need
to use an aol account. (although I did think it was pretty funny!)

Quit acting so pompus. Perhaps you don't realize it if pomposity is
a part of your personality. It is VERY annoying & perhaps you should
think about it. You are not any better than the rest of us. Treat
people the way you wish they would treat you, try putting yourself in
their shoes.

Quit taking swipes at people who take medication. At least they
are taking their medication & not a burden on society by living
in public funded hospitals.

Basically, stop being a prick. You do have some good info to share &
more people on Fido & internet would probably like you. This shit has
gone on for about 10 days & I KNOW are feeling weary by now.

73. FS: Private Patch V Autopatch

Newsgroup: rec.radio.scanner
Date: 1996-08-01 00:00:00 UTC
From: chrisre@chelsea.ios.com
Message-ID: <4tpdr5$o74@news2.ios.com>
Source record: 227953

I have a Private Patch V Interconnect Unit made by Connect Systems
Incorporated for sale.
* Remote Telephone Phone Patch (Simplex Autopatch/Full-Duplex Autopatch)
* Use as a Full Repeater.
* Use as a Cross-Band Repeater
* Auxiliary Relays
* 99 memory speed-dial
* Programmable Options
* Programmable CW ID
* DTMF page
* Manual/Docs included
* many more features...

(I placed this on the Net for sale before and apologize to those
who responded. I was unable to answer because of a crash and lost
your e-mail addresses.)

Runs around $400+ from major ham radio outlets.
Will sacrifice for $250 or Best Offer. I'll pay UPS insured shipping.
Will consider trade +/- cash for Motorola HT/mobile.

Call my toll free voice mail/pager at 1-888-752-0856 if serious.
Chris

74. FS: Regency R-1600 Scanner

Newsgroup: rec.radio.scanner

I have a Regency R-1600 mobile/base scanner for sale.
(This scanner is exactly like the Bearcat 950XLT)

Unit includes:
* 100 Channels
* Optional CTCSS and RF Amp Unit
* Service Search for Police, Fire, Air, Weather, Marine
* Tape Out and External Speaker jacks on rear.
* Power supply
* Manual
* Box
* Mounting Bracket

Unit has no antenna, but unit has a BNC connector on the back.
Unit has two velcro stips on the top.
Unit is in very good condition.

$150.00 will take it. I'll pay UPS insured shipping.
Will consider trade +/- cash of Motorola HT equipment.

Call my toll free voice mail/pager at 1-888-752-0856 if serious.
Chris

75. WANTED: Motorola Bravo/BravoPlus Pagers

*** WANTED: Motorola Pagers ***
I am looking for and will offer money for the following pagers:

$15.00 for any WORKING Bravo Plus or Bravo Classic Pager.
$10.00 for any WORKING Bravo pager (standard).
(The regular Bravos do not have time in the display)
$5.00 for any NON-WORKING Bravo, BravoPlus or Bravo Classic WITHOUT a
cracked display.

WORKING = functional display, vibrate, beep.
No light is OK. Scratched, dented, cracked case is OK.
PLEASE, no NEC's or other brands.

Serious inquiries, call my toll free voice mail/pager at 1-888-752-0856.
Thank you.
Chris

For sure. The only thing about a dBase file is that it will carry
its formatting into the new host (in most cases), a definite plus
since comma-delimited files have to be formatted.

Fun stuff, databases, eh?

On July 5th, we moved to our own domain name at www.hamradio-online.com.
Unfortunately, the company we rented server space from announced on July 13th
they are leaving the web hosting business. Thanks to California Wireless, Inc.,
we have moved Ham Radio Online to their server which you can access for now
using this IP address:

http://206.13.40.11/

We are working to get the www.hamradio-online.com domain name redirected to the
new web site. In the interim, please use the IP address shown above. The new
web server is located in California's Silicon Valley so west coast readers
should see relatively good performance.

We also have begun adding August articles.

From: ea3aai@intercom.es
Message-ID: <4toi54$64i@artemis.ibernet.es>
Source record: 227962

I have an approach chart for runway 07 in the Barcelona airport, with many frequencies listed as:

TWR: 118.100
APP : 127.70W, 126.50E, 124.70, 119.1
VDF : 119.1
GND : 121.700

I know that 119.1 is the real approach frequency so, what does VDF mean ?. And, 124.700 is not an approach frequency, since many flights sign on this freq. but they do not land in Barcelona and make QSY to another control/route freq. Anyway, many pilots call "Barcelona approach" in this channel. I thought that "approach" means "landing" !!.
No doubt with the meaning of TWR/APP/GND, but there are other columns with headers: GCA, PAR, SRE and SAR which are left blank. What do they mean ?

Thank you in advance.

Hi all,
Just wondering if it is worthwhile to make my scanner to listen to
military freq. I have PRO 39 scanner and planning to buy the converter so
that I can listen to military comms. Would like to hear from someone who are
using such converters. How effective are those units and where did you buy it
from. Thanks a lot for your consideration in advance.

FCC License Data Sources
Bill McFadden
bill.mcfadden@tek.com

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $104, and the mapping version is $174.

Floppies are available by state for $44 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155 (voice) or http://www.grove.net/ (WWW).

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. Regional CDs cover subsets of the US but come with a more powerful database manager and provide more detail about each license. Also available is a Ham callsign and repeater database CD.

| Spectrum costs $37, and the Ham and Repeater Database is $22. Regional CDs are $137 for the first CD, $102 each additional CD ($560 for the entire 6 CD set). Data is updated twice a year. PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), support@perconcorp.com (email), or http://www.perconcorp.com (WWW). The Spectrum database can be searched free of charge via Percon's WWW page.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. The report includes a color plot with transmitter sites marked.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Reports are $26 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services and all frequencies. Data is updated approximately every six months.

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy (FCC215.ZIP) downloadable from their BBS at 360-871-4228 (below 9600) or 360-871-4591 (9600-28.8k). ScanWare Associates can be reached at 360-698-1383 (voice), 360-698-8207 (fax), scanware@sincom.com (e-mail), and http://cutter.sincom.com/~scanware/index.html (WWW).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

Ultrix <ultrix@aimnet.com> wrote:

>I am curious about the difference between the OS456 and the CE232.

The OS456 replaces the scanner's CPU. The CE-232 works as a robot, not only for control of the scanner, but also for data collection from it. The CE-232 does not replace or interfere with the scanner's CPU, nor does it replace anything else in the scanner. The CE-232 is strictly bolt-on. I don't believe the OS456 uses the scanner's memory, either. The CE-232 does. The CE-232 does not alter any aspect of the scanner's performance or functionality.

>From preliminary info I can see the the OS456 is the superior interface for
>the PRO 2006.

That's arguable with no clear-cut winner. The two are different products that actually can compliment each other with very little in the way of toe-stomping. The OS456 may be handicapped if the scanner is operated away from the computer. You can connect and disconnect the CE-232 all day long and not impact the scanner. The CE-232 is installed in a "parallel" manner with the scanner, whereas the OS456 is aptly a series insertion device.

>But would like to get a little bit more info on the CE232.

For the PRO-2004/5/6, the CE-232 is a 2-way interface; collects data from the scanner and send it to the PC for display and processing as desired. Also controls the scanner and AutoProgram's the scanner's memory channels from a plain ASCII text file.

>The type of info that I am looking for is features, and a little bit of
>technical insight on how the device actually interfaces with the scanner.

The OS456 replaces the CPU altogether, but it cannot AutoProgram the scanner's memory. Aside from that, it's pretty open-ended as I understand it. The OS-456 has to go with the one scanner where ever it goes. One CE-232 can be used with a variety of scanners, first one, then another, then another, etc.

>From what I have heard, the OS456 interfaces into the Microcontroller in the
>Pro 2006. Is this true??

No. You actually cut the CPU data lines to the PLL and Display and the OS456 goes into the cut, as it were, in series, with the CPU taken out of action altogether.

>How does the CE232 do it??

Collects display data from the serial data line between the CPU and
the LCD Display driver. All data that appears in the scanner's LCD
display is available to the PC for a variety of storage and
processing. Control and AutoProgramming are done by what I call
"Keyboard Emulation" where electronic key-presses are sent to the
scanner as desired or as automated.

> I am just interested
>in making an un-biased comparison of the two interfaces to fully understand
>schemes and engineering. OptoScan makes the OS456, who makes the CE232???

I do. <smile> The heart of the CE-232 is the Motorola 68HC11F1F1

The CE-232 has 22 unallocated bits available to the user for whatever
purpose he can cococt. Of these, 14 are INPUT bits and 8 are output
bits. You can feed data into the INPUT bits and the CE-232 will
"look" at that data and make decisions (IF : THEN : ELSE) based on
what you want. The OUTPUT bits can be used to trigger external
switches of most any sort. Output bits are set by logic
decision-making based on most any criteria desired by the user.

The CE-232 also has an AutoLogger that records a comma-delimited line
of text for every "hit" or stop by the scanner. All scanner Display
data are available for logging as well as the 22-bits of IN/OUT bits.
Fer instance, it is possible to feed the output of a 10-seg LED
S-Meter through a BCD Decoder back into the CE-232's INPUT registers
and display the binary result (0000 - 1010) .....and AutoLog it
accordingly.

A script if running, can be told to make the scanner skip all signals
with an S-4 or lower, for instance (resume scanning), or even the
opposite, skip all signals greater than a specified S-level.
Possibilities are endless.

The CE-232 sports an AutoReject feature where if a frequency is put
into the Reject file, and the feature turned on, the scanner will not
stop on that frequency. The AutoReject file can contain up to 32,000
frequencies.

One great use is to run a script to identify "Birdies", and then place
the Birdie list in the Reject file, and voile! No more stops on
birdies. Add pagers, data channels, and other undesirables for
hassle-free scanning.

I think I've forgotten a few other things the CE-232 will do, so look
though the article queue on this or alt.radio.scanner for the first
post in a thread called

Scanner-Computer Interface of July 19, 1996

where I posted a technical dissertation on the CE-232.

Like I said, the CE-232 and the OS456 don't seem to compete. I know a
few guys who have and use both. There are about a thousand CE-232's
out and about, and of those, I know of only two instances where the

people thought they got a bad deal, and each of those is a special case related more to the person than to the interface. I'm saying that most CE-232 users are positive about it.

But then I've not heard anything negative about the OS456 either, other than the supplied software that comes with it is pretty weak and most guys wind up buying an expensive 3rd party control program for it. Now the control program for the CE-232 is pretty hokey looking, though it doesn't lack in power and capability.

Maybe others will pipe in and tell you more about the OS456. I can tell you about the CE-232, though.

Rgds,

Bill

Your mail bombs are ineffectual because they do not reach my mail box and time is not spent in downloading or reading them Don't you understand that filters can be applied; mail checked while it's still at the ISP; and otherwise managed and manipulated REMOTELY?

> Why do people complain about Bill.
>
>Well, many have complained about his use of the newsgroups.

Not really "many", Katzenjammer. Just you...and a few like you who fart and snivel when I don't "obey" you or live up to YOUR expectations. No one has to obey you or meet your expectations, Katz.

And that just unnerves you to no end.

>I don't recommend mail bombing him.

But you already DID, stupid! Now I am ready for mail bombs. They are most easily defended and....returned.

>I'm really getting sick of this stuff and I don't think this belongs
>here!

You sure are going out of your way to keep it going..... And I have the same question for you and I did for your Aunt Alexander:

WHAT MAKES YOU THE HEAD CHEESE AROUND HERE? Where do you get off levying tariffs and taxes?

Source record: 227971

I can get a BC-700 at very good price but I wasn't sure if they were ever cell-blocked. Monitoring Times had an article to modify it for cellular reception back in 1993, but that was before the ECPA ban on the importation of easily modifiable cell scanners... The scanner was advertised in a 1995 catalog.

>Well, lets just say we had a promising exchange of email the other day.
>I'd characterise it more like waiting for the other shoe to fall.
>(.....God, this is getting old...)

Why would you characterize it that way? I should think you could view
the historical record. I am -=not=- the aggressor; not now; not ever.

I do not flame first.
I do not mail-bomb first.
I do not threaten first.

When flamed, bombed, and/or threatened, then I act or react as I see
fit. But I think there is some confusion with my name.

Some people think just because my name is "Cheek", that when smacked,
I should turn the other one. <grin>

But my name isn't Jesus. It's Bill. "Bill" is an old Cherokee name
that means "if you can't take it, don't dish it out". Besides, all
four of 'em (cheeks) got used up a long time ago, and there ain't any
room left for others to step in and have a go at smacking even one,
much less two or three.....

So it is a confusion issue, I am sure.........

May I suggest you try the following.

Start by checking grounds.

- make sure the ground from the engine to the firewall is ok
- made sure the ground on the exhaust is ok
- antenna grounds
- radio
- battery to anything.
- Power your scanner directly from the battery. This would
eliminate a poor ground path.

Noise is still their?.....

- clean the inside of you distributor cap with alcohol.
- make sure the ignition wires (spark plug wires) are clean,
not arcing anywhere making good contact to the sparkplug.

TIP: you can test for a leaky cable at night with a water spray
bottle. Spray a heavy mist and see if you see any sparking and if the
noise changes.

- Ignition coil may be leaky, spray water around it also and look for
change in noise or visible sparks.

Most of the time when I've fixed these problems for others I've
wiggled wires and used a spray bottle. Most of the time it can be
found this way.

In the past when I installed radios into police cars we had to ADD
ground straps to the trunk, hood etc.

Let me know how you make out. Or if any of the above makes a change
I may then be able to suggest further action.

Remember a car will generate electrical notice. It is normal to have
some noise. Some radios are better then others at dealing with
this.

just trying to minimize it.

>DOES ANY HAVE AN EXAMPLE OF WHAT INFO A RADIO PROGRAMER WOULD TYPE INTO
>A COMPUTER WHEN HE LOADS A 800 OR 900 MHZ TRUNKED RADIO?

Not really, I would say that its different for every model radio.

> ALSO ARE
>TRUNKED RADIOS ABLE TO BE CLONED?

Yes, some models can be. I know that the older Standard radios can be.
The problem lies with the companies having difficulty charging you
when they don't know you have a second radio. Also you are supposed
to be licenced for each radio you have.

>CAN A TRUNKED RADIO BE MADE TO LOOK
>LIKE ANOTHER.MEANING DO TRUNKED RADIOS EACH HAVE THERE OWN FINGERPRINT
>WHEN THEY ARE SET ON A SYSTEM,I SO CAN A RADIO BE MADE TO HAVE THAT SAME
>FINGERPRINT?

If you have the hardware to change a chip in the radio that contains
the serial number then you can clone it. It depends on the
type of radio you have. The older trunked Standard Radios are easier
to do. It can all appear to be the same radios to the company
providing your service.

They in time may catch on though. If you use it to take on it will
show up as a heck of a lot more traffic on one radio then others in
your fleet.

If you give me more specific info I may be able to give you more
information.

What type of trunking system?
What type of radios?

Bill Cheek as we all know, knows a lot about all sorts
of crap. Heck he shows us in all his messages.

I think his problem is that he has a lot of time and nothing
to do with it.

Well I suggest we find him a job as a butt washer. He can
start by cleaning his on shit. He sure has a lot of it.

Willy Cheek Shadow.....Hi Willy

I hear its been a slow month for Billy boy.

List of time to spend on the internet Billy?

Have you found a job yet?

I hear your wife gained a few pounds since that 1950's picture on
your web page.

What's wrong with updating it? It's Ok billy. lost of guys have
ugly wifes..

Man she's ugly...did she had a face job recently?

The scanner should be capable of standard VHF-UHF freqs. There is no
way to obtain bands not already designed for it. Here is a list of
bug freqs and related information compiled by Roger Cravens.

Bill

Bugging Frequencies

Major "Real-World" Bugging Frequencies

Over the years I have had numerous TSCM and intelligence people ask
for an outline of the RF spectrum used by bugging devices. Bugging
devices can appear on any frequency between DC and light, this list
covers the more common bugging frequencies that tend to be used.

The frequencies that follow are all based on hard documentation (catalogs, intel reports, technical materials, etc...). For the purpose of intelligence analysis the Source Reliability Scale should be considered A, and the Data Validity Scale should be rated as 1.

This list is updated every two or three weeks, please foward (via US Mail) any technical materials you would like to see reflected in the list.

Remember to check the entire RF spectrum, not just specific frequencies; however, keep in mind that people doing buggings like to stay clustered around certain frequencies.

Summary (this will catch 99.99% of all Non-Intell/Diplomatic RF bugs)

All TSCM Inspections should include the following frequencies:
(Expect to see less than .5-25 mw maximum at the TX antenna)
(Do not expect the signal to be present for more than 20uS-100uS)

To find RF transmitters a search grid of roughly 15 foot by 15 foot (the size of an average office) should be used.

All phone rooms, riser closets, demarcs, boots, etc. MUST be checked.

Remember that the microphone/camera can be hundreds of feet away from the transmitter.

Use a digital spectrum analyzer and a wideband receiver with an analog 10.7/21.4mhz SDU on the IF, dispersions of 100/200/500khz).

RF Spectrum Analysis and monitoring should take place for at least twelve solid hours during a regular sweep (72 hours or more is preferred).

To prepare for IPM the spectrum should be evaluated/monitored for at least four hours prior to the event.

Most non-gvt RF bugs will have a transmit frequency between 9khz and 6ghz.

The Spectrum Analyzer inspection must cover at least 3khz to 40 ghz

VLF Detection-Audio .3 khz to 100 khz Video Cameras &
Tape recorders
VLF Detection-RF 12 khz to 500 khz Video Cameras &
Tape recorders
VLF Detection-Audio .3 khz to 150 khz Microphone/Ultrasonic
Chirping

Carrier Current Bugs 3 khz to 50 mhz 99% Voice
Carrier Current Bugs 20 mhz to 300 mhz 99% Voice
(AC Mains Antenna)

RF Bugs-HF 3 khz to 50 mhz 99% Voice
Space RF Bugs-VHF 30 mhz to 300 mhz 10% Video/80%
Voice/10% Data

Space RF Bugs-UHF 300 mhz to 900 mhz 25% Video/60%
Voice/15% Data

RF Bugs-Microwave1 900 mhz to 3.0 ghz 70% Video/20%
Voice/10% Data
RF Bugs-Microwave2 3 ghz to 18.5 ghz 75% Video/15%
Voice/10% Data
RF Bugs-Microwave3 18.5 ghz to 40.0 ghz 75% Video/ 5%
Voice/20% Data

...and of Course Infrared! (Look for "IR Blooms")

700 - 1100nm Audio Transmitters/Lasers (CF between 880 and 950nm)
750 - 900nm Night Vision Illuminators
900 - 1710nm IR Video Illuminators

Note:
Most military/intelligence and governmental TSCM inspections look for devices between 3khz to 220/300mhz for Carrier Current, 20khz to 40ghz for regular free space RF radio devices, and directional microwave devices from .3ghz to 110/120ghz.

Common Wireless Bugs (Low Power - Well under 35-50 mw)

44.500 - 51.000 mhz "Baby/Room" monitors
72.100 - 75.400 mhz Hearing Assistance systems
54.000 - 150.000 mhz "Kit" Bugs

98.000 - 108.000 mhz Cheap out-of-band FM Bugs
112.000 - 142.000 mhz Cheap out-of-band FM Bugs
140.000 - 160.000 mhz Cheap out-of-band FM Bugs

60.000 - 320.000 mhz Low Cost kit bugs
398.000 - 406.000 mhz DECO Bugs (398.600/605, 399.450/455, 399.025/030, 406mhz)
25.000 - 450.000 mhz European/English Kit Bugs

150.000 - 216.000 mhz Typical VHF "Body Wire" & Pro-Grade Bugs
109.000 - 140.000 mhz Digital VHF Pro-Grade Bugs
138.000 - 174.000 mhz Typical "Spy Shop" & LE Cheap VHF Bugs (155-172 Popular)
140.000 - 150.000 mhz Popular Xandi Flea power kits (143/144mhz)
150.000 - 170.000 mhz Popular Japanese Flea power kits (under 5mw)

150.000 - 220.000 mhz Commercial Wireless Microphones
169.000 - 172.000 mhz 47 CFR 90.265 Authorization (VERY Popular)
174.000 - 216.000 mhz 47 CFR 2.106 (NG115) Authorization
395.000 - 410.000 mhz German UHF Wireless Microphones (PK Electronics)
219.000 - 530.000 mhz English UHF Wireless Microphones

(300-500 popular)
470.000 - 608.000 mhz Commercial Wireless Microphones
730.000 - 806.000 mhz Commercial Wireless Microphones

889.000 - 960.000 mhz Modified Cordless Phones (S/S & Hoppers)

380.000 - 480.000 mhz Video Bugs - US
890.000 - 960.000 mhz Video Bugs - US (902-928 Hot)
905.000 - 928.000 mhz Video/Audio Consumer Products
(i.e.: Recoton)

1.700 - 1.930 ghz Video Bugs - US
2.400 - 2.500 ghz Video Bugs - US *** VERY Popular ***
5.725 - 5.850 ghz Video Bugs - US *** VERY Popular ***

1.100 - 1.400 ghz PAL Video Bugs *Very Hot in
England/France/etc*
2.400 - 2.500 ghz PAL Video Bugs *Very Hot in
England/France/etc*
3.500 - 4.500 ghz PAL Video Bugs *Very Hot in
England/France/etc*

430 - 550 mhz Popular French Video/Audio Bugging System
950 - 2500 mhz Popular French Video/Audio Bugging System
700 - 900 mhz Popular Italian Audio Bugging System

"Tactical" Bugs

225 - 400 mhz "Throw away" bugs (10uw-300mw Beer can bugs)
290 - 330 mhz Micro-powered Bugs (5uw-10mw Cigarette Butt Bugs)

30 - 500 mhz Tactical Repeaters (75mw-300mw)
285 - 400 mhz Tactical Repeaters (50mw-10watts)
100 - 152 mhz VHF Tactical Repeaters (300mw-25watts)
135 - 174 mhz VHF Tactical Repeaters (300mw-25watts)

VLF and Carrier Current Type Bugs

9khz - 490 khz Carrier Current 47 CFR 15.219 Auth
(250 mv max.)
490khz - 1.705 mhz Lossy Cable 47 CFR 15.221 Auth
(1000 mv max.)
450khz - 30.00 mhz PLA Systems 47 CFR 15.207 Auth
(30 mv@ft/30ft max.)

3 - 200 khz 300 mw High Grade Pro Bugs (over 500$
each)
100 - 200 khz 50-100 mw Older Bugs
120 - 200 khz 30-50 mw Pre 1990 intercoms
200 - 300 khz 30-50 mw Post 1990 intercoms
300 - 400 khz 250-400 mw TELCO Line transmitters (355khz
popular)

300hz - 30 khz Cable TV Carrier - Hardwired microphones
30khz -300 khz Cable TV Carrier - Coaxial Bugs

100 - 450 khz Threat Window #1 Most CC Bugs
3khz - 3 mhz Threat Window #2 Expensive "Pro-Grade" Bugs
5khz - 32 mhz Threat Window #3 Popular WJ Carrier Current Rcvr
3khz - 50 mhz Threat Window #4 Realistic Threat Window
for Telephone Wire
15mhz - 70 mhz Threat Window #5 Audio/Video "Micro-Wire"
RF circuits

WECO Bugs "boosted/ultrasonic audio" found on Power/CATV/Telco lines

64kbps to 1.5mbps Digital Bugs T-Carrier-Lo (T-1 and Below)
1.5mbps to 50mbps Digital Bugs T-Carrier-Hi (T-1 and above)
2.048mbps Digital Bugs Definity Circuit Pack Bug
32mbps Digital Bugs TMS Channel/Backplane bridge
Designed to transmit on CC or Microwave ISM Spread Spectrum
(2.4-6.0ghz)

VLF Devices
25khz - 90khz Tape Recorder Bias Osc-Low End (35-45khz Common)
80khz - 145khz Tape Recorder Bias Osc-Mid Range
(88.2, 96, 100khz Common)
100khz - 325khz Tape Recorder Bias Osc-Pro Grade
(100, 150, 300khz Common)
40khz - 50khz Tape Recorder DAT/Hi8
(44.1/48khz Common)

8khz - 35khz Recorder Audio Servo Noise (10-20khz Common)

7khz - 35khz Video Camera VLF Detectable emmisions
15.750 mhz Common NTSC Video Camera
15.734 mhz CCD/PCB Video Camera (very easy to detect)
15.625 mhz Common Video Camera

Also, be aware of ultrasonic/audio emmisions from most VLF devices.
(Utilize a EOD/Bomb Tech Stethoscope, and Ultrasonic Spectrum
Analyser)

Commonly Used Law Enforcement Bugging Frequencies

37.000 - 952 mhz FCC Surveillance Blanket Authorization
47 CFR 90.19 "Physical surveillance, stakeouts, raids..."
Straight AM/FM, FM-Subcarrier, SSB, Spread Spectrum, and Hoppers.
If encrypted, it usually uses in-band voice inversion or DES.
(Normally well under 2 watts... most under 35-150mw)

148 - 174 mhz
135 - 250 mhz Out-band Wireless Microphone
174 - 216 mhz In-band Wireless Microphone
350 - 440 mhz Common Video Freqs
380 - 930 mhz Wide Band Hoppers
806 - 824 mhz

851 - 869 mhz
905 - 930 mhz Popular Audio/Video Band

1.4 - 1.5 ghz Common Video Freqs
1.7 - 1.9 ghz Common Video Freqs (1.710 - 1.755 REAL Popular
at 1/10 watt)
2.4 - 2.5 ghz Common Video Freqs (2.400 - 2.450 REAL Popular)
5.7 - 5.9 ghz Common Video Freqs (5.725 - 5.850 REAL Popular)
8.5 - 10.8 ghz Common Video Freqs

AID - Westinghouse/Audio Intelligence Devices, Inc. Bug Freqs
150 mhz - 174 mhz Standard/Primary Band (Most Popular)
135 mhz - 150 mhz Special Order/Secondary Band
216 mhz - 220 mhz Special Order
400 mhz - 470 mhz UHF Repeaters

36 mhz - 39 mhz Very Low Power WFM (.5mw - 50mw)
Very Dangerous
80 khz - 200 khz "Line Carrier" Microphone Systems
Very Dangerous

1700mhz - 1900mhz 25-250mw Video and audio bugs
(Mostly DEA/DOJ stuff)
2450mhz - 2484mhz 25-250mw Video and audio bugs

If the signal is "scrambled" it is nothing more than simple voice
inversion, a circuit to "de-scramble" costs around $20.

Note: AID devices are often re-tuned for outband channels... so be
careful.

The area of spectrum from 35mhz to 500mhz is the primary threat,
500mhz
to 3ghz is the secondary threat, a "line carrier" threat is from 30khz
to 750khz.

If the person planting the bug suspects that a TSCM may be conducted
then AID suggests a frequency between 30mhz to 50mhz, sensitivity of
rcvr should be better than .18uv/-122dbm.

Also, keep in mind that AID devices are frequently used for illegal
buggings, so be familiar with what their realistic specs are, expect
power outputs under 50mw, and expect to see the AC power circuits
being
used as the antennae.

Security Research Bugs
145 mhz - 175 mhz FAST-II-L Computer Bug - 1, 3, 10, 30, 100mw
170 mhz - 204 mhz FAST-II-H Computer Bug - 1, 3, 10, 30, 100mw

60 khz - 200 khz "Line Carrier" Microphone Systems
Very Dangerous

1.1 ghz - 1.4 ghz 250mw Lynx Video/Audio Bugs (L-Band)
2.5 ghz - 2.6 ghz 250mw Lynx Video/Audio Bugs
3.8 ghz - 4.2 ghz 250mw Lynx Video/Audio Bugs

Note1: LYNX video bugs and cameras are frequently built into old bricks,
wooden joists, logs, gate posts and such... VERY, VERY Dangerous and easily concealed.

Note2: Most Security Research Bugs utilize fixed frequency inversion to
protect against detection, the most commonly used frequency is a 1.862khz inversion point.

173.075 - LOJACK Auto tracking system beacon (200ms burst every second)

Police Speed Enforcement Radar
10.450 - 10.600 ghz X-Band
11.488 - 11.628 ghz RD Detector
22.976 - 23.256 ghz RD Detector-2nd Harmonic
24.050 - 24.250 ghz X-Band
33.400 - 36.000 ghz Ka-Band
700nm - 1100nm Laser Threat

Electronic Article Suveillance/Anti-Shoplifting Systems
8.10mhz - 9.30mhz Checkpoint (Hi-Q Tags) 8.2mhz Common
57.75khz - 58.75khz Sensormatic (Magnetic) Books, CDs, and Tapes
915mhz and 1830mhz Knogo (Microwave Resonant) Adhesive Labels

25 - 50 mhz "Bumper Beepers" (38 - 47 mhz very popular)
135 - 170 mhz "Bumper Beepers" (150-170 mhz very popular)
450 - 512 mhz "Bumper Beepers"
903 - 904 mhz "Bumper Beepers"
904 - 912 mhz "Bumper Beepers"
918 - 926 mhz "Bumper Beepers"
926 - 927 mhz "Bumper Beepers"

WARNING:
The area between 900 mhz and 6 ghz is ** EXTREMELY DANGEROUS ** as the eavesdropping equipment in that range is inexpensive, low power, and highly directional.

Additionally, most TSCM people will not check frequencies above 1.0/1.5
ghz or 3 ghz (because the equipment is too expensive for them to buy).

I have seen surveillance video tapes of TSCM inspections where the video
cameras (Watec), microphones (Sony), and microwave RF transmitters (AID
- 2.4ghz) were never detected by the inspectors (using 1ghz AVCOM Spectrum Analyzers).

Surveillance Satellite (TK-Keyhole) Frequencies
Note: Mostly Wideband Spread Spectrum/LPI channels

420mhz - 450mhz
1.2ghz - 1.4ghz
1.7ghz - 1.9ghz (1.76-1.84 real active)
1.9ghz - 2.2ghz (2.115 real active)
4.9ghz - 5.0ghz
7.5ghz - 8.3ghz
10.6ghz - 12.6ghz (11.7-12.2 active)
17.8ghz - 21.2ghz (SIGINT Birds)
23.6ghz - 24.0ghz
25.5ghz - 25.7ghz
22.8ghz - 33.5ghz (30-31ghz SIGINT Birds)
42.5ghz - 47.0ghz
50.3ghz - 52.4ghz
78.0ghz - 85.5ghz
86.3ghz - 98.3ghz (86-92 real active)

Note: Can be anywhere between 20ghz and 110ghz, mostly spread spectrum

Commonly Used by Federal Agencies for Bugs, Wireless Microphones, and
Body Wires (also 138-220 mhz, and 399-420 mhz, under 25-50 mw).

960-1215mhz Spread Spectrum Systems (Wideband)

Generally Recognized Federal Bug/Spy Bands
Primary - 25-50mhz, 135-175mhz, 225-440mhz, 1710-1950mhz,
8.3-12.5ghz
Secondary - 890mhz-5.50ghz, 7.0-9.5ghz, 10-39.6ghz

Also, Wide Band Frequency Hopping centered on various UHF-TV channels
(ie: 510 or 670 mhz with a hopping width of +/- 25 mhz)

Keep in mind that the federal government can use virtually any
frequency
between DC and light.

Spread Spectrum/Hopping Bugging Frequencies

Legit Industrial Equipment (very inexpensive)
902 mhz - 928 mhz ISM band A (Very Popular)
2400 mhz - 2484 mhz ISM band B (Very Popular)
5725 mhz - 5850 mhz ISM band C
10500 mhz - 10550 mhz ISM band D
24075 mhz - 24250 mhz ISM band E

SS Amateur Radio Bands Often used for eavesdropping (very inexpensive)
50 mhz - 54 mhz 6.00m Amateur Radio Equipment (STA)
144 mhz - 148 mhz 2.00m Amateur Radio Equipment (STA)
222 mhz - 225 mhz 1.25m Amateur Radio Equipment (STA)
420 mhz - 450 mhz 70cm Amateur Radio Equipment (47 USC 97.305)
902 mhz - 928 mhz 33cm Amateur Radio Equipment (47 USC 97.305)
1240 mhz - 1300 mhz 23cm Amateur Radio Equipment (47 USC 97.305)
2300 mhz - 2450 mhz 13cm Amateur Radio Equipment (47 USC 97.305)
3300 mhz - 3500 mhz 9cm Amateur Radio Equipment (47 USC 97.305)
5650 mhz - 5925 mhz 5cm Amateur Radio Equipment (47 USC 97.305)

SS Amateur Radio Bands Occasionally used for eavesdropping
10.00 ghz - 10.50 ghz 3.0cm Amateur Radio Equipment (47 USC
97.305)
24.00 ghz - 24.25 ghz 1.2cm Amateur Radio Equipment (47 USC
97.305)

47.00 ghz - 47.20 ghz 6.0mm Amateur Radio Equipment (47 USC
97.305)

SS Amateur Radio Bands Rarely used for eavesdropping (very expensive)
75.50 ghz - 81.00 ghz 4.0mm Amateur Radio Equipment (47 USC
97.305)
119.98 ghz - 120.02 ghz 2.5mm Amateur Radio Equipment (47 USC
97.305)
142.00 ghz - 149.00 ghz 2.0mm Amateur Radio Equipment (47 USC
97.305)
241.00 ghz - 250.00 ghz 1.0mm Amateur Radio Equipment (47 USC
97.305)
300.00 ghz - Light (3 Thz) Amateur Radio Equipment (47 USC
97.305)

Note: Most commmon spread spectrum/hopping bugging equipment will hop
at
speeds between 100 and 50,000 hops per second. Equipment is readily
available that hops even faster (100,000 to 300,000 hops per second).
Dwell times can be as small as 1us (one widely used military system
uses
a dwell time of 3-5us)

Outband Equipment
ANY Television broadcast or Cable TV frequency
ANY FM radio broadcast frequency
ANY Paging or Beeper frequency
ANY Cellular Telephone frequency

820 mhz - 960 mhz Modified (902-928) Cordless Telephones
Modified Amateur Radio Equipment (can be on ANY frequency)

Keep in mind that wideband (non-ISM) Spread Spectrum/Hopping Bugs are
very
difficult to detect(even if you are within a few feet). Watch for
carrier
feed-through, and "Noise Floor Humps".

All Spread Spectrum devices are detectable

Once Spread Spectrum/Hopping Bugs have been located (on the RF
spectrum)
all that can be done is to locate the sourse of the emission... it is
virtually impossible to demodulate a SS signal unless you have access
to
the key.

Also, a 500mw ISM device can easily have an effective range of over 20
miles.

Look for spectral anomalies (humps) on the Spectrum Analyzer, and back
up with a Compressive receiver.

Note: In the early 80's I spent considerable time working with diplomatic spread spectrum bugging devices operating on frequencies between 20ghz and 56 ghz, using a 3ghz window.

Band Width Resolution and Filters
Examine the spectrum with the following BW resolutions/filters:
Utilize all BW resolutions/filters between 5hz - 200mhz (depending on band being checked)

For frequencies between 9khz and 7ghz I generally prefer to start with a
3mhz IFBW for a "moving" sweep, and to monitor the (wideband spectragram). This makes the energy easy to spot, but tough to identify.
The IFBW is then modified until it is roughly 85% of the signal bandwidth, the results are then sent through a vector analyser for identification.

All IFBWs available on the analyser are also cycled through and the results overlayed into a matrix, a little vector analysis is applied, and the channel parameters are easily extracted.

To handle the microwave bands IFBWs between 10khz and 200mhz should be used.

Real World Example:
Frequency Hopping bug, randomly hops between 630mhz and 700mhz, a IFBW of 70mhz will allow the activity to be easily identified, but a narrower
IFBW will make it much more difficult.

Hint: A programmable digital spectrum analyzer should be used!
(1/3/5/10/15/20/25/30/50/75/100/150/200... Sequence is prefered)

BW Res - Usage/Primary Function
100/200 mhz - Resonate Cavity Bugging Devices/SIGINT Devices
125/35/8mhz - Resonate Cavity Bugging Devices/SIGINT Devices

50/20/10mhz - Diplomatic/Intelligence Microwave Bugs
40/20/10mhz - Diplomatic/Intelligence Microwave Bugs

13/16/20mhz - Microwave Wideband
11/12/13mhz - Microwave Wideband
.5/1/2/5mhz - Microwave Wideband (Burst Bugs)
18/26/36mhz - Satellite Wideband (Video)
2/4/6/8 mhz - Microwave Wideband (Video)
3/6/12 mhz - Microwave Wideband (Video) - Common
.5/1/3 mhz - Microwave Wideband (Video/Burst/Pulse)

1.5/.75 khz - Frequency Hopping Bugs - VERY Common
.4/.2/.1khz - Frequency Hopping Bugs - VERY Common
3.2/6.4 khz - Frequency Hopping Bugs - VERY Common
10/20/25khz - Frequency Hopping Bugs - VERY Common
50/75 khz - Frequency Hopping Bugs - VERY Common

100/250 khz - Frequency Hopping Bugs
300/500 khz - Frequency Hopping Bugs
1/2/4/8 mhz - Frequency Hopping Bugs

300/250 khz - Regular Wide Band Broadcast FM
150 khz - Narrowband Broadcast FM Audio, Television Audio
280 khz - Narrowband Broadcast FM Audio, Television Audio

200/150 khz - Commercial Wireless Microphone - High Grade
150/100 khz - Commercial Wireless Microphone - Concert/Broadcast Grade
58/77/84khz - Commercial Wireless Microphone - Typical Body Wire
50/60/75khz - Commercial Wireless Microphone - Typical police device
8/25/50 khz - European/Japanese Industrial Bugging Devices

50/30 khz - Wideband FM two-way communications (ie: Cellular
Telephone)
16/15/6khz - Normal FM two-way communications
3/6/8/12khz - Narrowband Commercial - Voice
1/3.2/6khz - Narrowband (Marine, HF, etc...)

120/9/1 khz - Narrowband (Bias Osc./Video Cameras/SIGINT)
30/750/500hz- Narrowband (Bias Osc./Video Cameras/SIGINT)
56/75/100hz - Narrowband (Bias Osc./Video Cameras/SIGINT)
30/150/200hz- Narrowband (Bias Osc./Video Cameras/SIGINT)
250/300 hz - Narrowband (Bias Osc./Video Cameras/SIGINT)

300/250 hz - Narrowband OOK/FSK/Data, etc...
300/250 hz - Narrowband OOK/FSK/Data, etc...

Subcarrier Detection:

10 - 500 khz - Most Commonly Used Subcarriers
30 - 150 khz - Typical Broadcast FM Subcarrier (FMSubC)
19/27/38 khz - Typical Stereo Broadcast FM Subcarrier (FMSubC)
67 khz - Typical Musicast/Musak Broadcast FM
Subcarrier (FMSubC)

2 - 10 mhz - Audio Subcarriers often used with Video
(4.2-8 mhz common)

5khz - 950khz - Realistic Subcarrier Threat (Audio)
1mhz - 15 mhz - Realistic Subcarrier Threat (Video)

Final Note:

Beware of people in the TSCM industry who try to convince you that
bugs
don't operate above 1ghz or 3ghz, the folks who push this line are
utter
frauds, and are playing games with you.

Several "hole-in-the-wall" TSCM schools sell equipment (at highly
inflated prices) and actively attempt to mislead students that all
they

have to do is spend $3000 to $5000 in equipment to enter the TSCM field.

Of course, these are the same crackpots who try to make you believe that
they are the only electrical engineer, ex-CIA, ex FBI, etc... in the TSCM business.

Ultrix@aimnet.com
I have a 2006 with a CE232 internally installed. Works excellently.
For the 2006, I'd recommend the CE232. It can program the radio's channel memory from a file in the computer as well as log the signals heard.
The CE232 connects to the radio's keyboard wiring & uses CMOS switches to imitate button presses. Everything you can do manually the CE232 can automate.
It connects to the radio's display controller chip to allow it to return the contents of the display when polled by the host computer.
The OS456 connects to the radio's PLL & VCO control circuits and thereby controls the radio directly. The channel memory is in the computer. When the computer is not hooked up & the OS456 software running, the radio behaves as stock using its own channel memory. The OS456 cannot load the radio's own memory.
In the 2035 and 2042 radios, things change. These radios don't have a separate display controller for the CE232 to monitor. Therefore it can't log signals.
Since the OS456's design is to control the radio, it retains all its functions in the 2035/42. The CE232 has no innate CTSS or DTMF reading ability as does the OS456/535, but it does have user-accessible parallel processor I/O that tone hardware could be hooked to. I have a Keyboard Memory Block controller and S-meter hooked to mine, readable & controllable by the computer.
If you have a 2006, get a CE232 unless you need tone decoding.
If you have a 2035/42, get the OS345/535.
The CE232 is more work to install. COMMtronics tech support is excellent.
For further info about the CE232 contact bcheek@cts.com
No affiliation, just a satisfied customer.

HI there... I just bought a BearCat 60xlt from the local K-mart.. and was wondering if there was a way that I can expand the rage of frequencies that it will pick up? Also, any interesting frequencies that a beginner should listen too (other than the weather ;) would be appreciated.. I'm in the northwest corner of the US.

Thanks
Andrew

> : high enough it's up to the airline.

The "10,000 foot rule" is not required by the feds. The FAA simply recommends that the airlines adopt such a policy. The recommendation is that passenger use of "portable electronic devices" be prohibited during phases of flight that require a "sterile cockpit". This is usually all aircraft movement, including movement on the ground, below 10,000 feet.

The federal aviation regulation addressing this is part 91.21. No where in 91.21 does it require that portable electronics be turned off below 10,000. What 91.21 does is *prohibits* the use of *all* portable electronic devices - with 5 exceptions. The 5th exception being PEDs that the aircraft operator has determined will not cause problems. The airlines try to set policies to comply with 91.21,ensure safety and still allow passengers to play with their Gameboys. In Advisory Circular 91.21-1, the FAA suggests the "10,000 foot rule" be part of such policies.

Feel free to read AC 91.21-1. I have the text at
ftp:\\ftp.ccnet.com\users\cwheeler\aviation\ac91211.txt

123. Exercise Global Yankee - northern NY State

Newsgroup: rec.radio.scanner
Date: 1996-08-02 00:00:00 UTC
From: tmartin@igs.net
Message-ID: <4ttnp2$2va@nntp.igs.net>
Source record: 227753

I have been monitoring an air combat training exercise in the Falcon MOA in northern NY State for a couple of days. All are UHF AM freqs.

228.7 - COBRAs (NY ANG F-16's)
233.6 - weak
251.8 - COBRAs, running intercepts
259.05 - (prev. unknown) CHALICE DELTA comms. AWACs?
303.9 - weak
309.5 - AWACs stuff with BACKBURNER, CHALICE DELTA
313.6 - COBRAs

Also heard FAC activity on 271.2 (THUNDER 10) and some tanker stuff on 276.5 and 238.9 (Maine ANG KC-135's).

I heard one group of players, the F-15's out of Otis, MA, couldn't join due to heavy ground fog at their station. I thought they were going up again this aft but so far nothing. The first weekend of the month is usually good for this type of activity in the MOA.

Is this the proper newsgroup for this type of stuff? I haven't seen reports like this in the times I've been here.

Terry

Here in Sou. Indiana, where we have a lot of deerm I sometimes hear "10-50 PD, car vs. deer." I think I remember one bored deputy asking "who won?" after one such dispatch.

s> the CTCSS control scan functions or audio output?

Supposedly it is tied into the squelch circuit, so that the squelch will not open unless the programmed CTCSS tone is received. Therefore, it should allow the scanner to continue scanning when transmissions without the correct tone are received.

Later,

Andrew

Again this is just one big "<Giggle>" to you.

Hay Bill you tried to help this guy out and so did I. Thats it. If you
wanted to turn this into a discussion you could have. But why then
turn it into a fight? No need to start with the attacks again.

Its all yours....show us what you're all about.
I don't need to continue you've done a great job I can see your
schooling has really paid off.

Here are two lists I got.

Pennsylvania State Police Frequencies

BASE MOBILE CHANNEL
154.755 Mobile - Mobile
155.580 154.950 A
155.670 155.910 B
155.505 155.850 C
154.665 158.910 D
154.695 156.150 E
154.920 154.830 F
155.790 159.030 G
155.475 Nationwide / Intercity
159.210 154.755 Mobile Repeaters
155.460 Tac 1
151.490 Tac 2
158.760 156.015 Admin / Phone Patch
159.045 156.195 Turnpike
159.075 156.225 Turnpike
159.000 Turnpike Mobile - Mobile
154.905 154.904 Unknown Use

~~~~~~~~~~~~~~~~~~~~~~~~~

The following is a list of PSP barracks and the frequencies they operate
on.

Channel A 155.580 Base/154.950 Mobile

Lamar, Clinton Co. Shamokin, Northumberland Co.
Trevose, Bucks Co. Selinsgrove, Snyder Co.
Coudersport, Potter Co. Somerset, Somerset Co.

Channel B 155.670 Base/155.910 Mobile

Foglesville, Lehigh Co. Fernridge, Monroe Co.
Philadelphia, Philadelphia Co. Avondale, Chester Co.
~~~~~~~~~~~~~~~~~~~~~~~~~

Danville, Montour Co. Milton, Northumberland Co.
Bloomsburg, Columbia Co. Milesburg, Centre Co.
Limerick, Montgomery Co. Ephrata, Lancaster Co.
Harrisburg, Dauphin Co. Swiftwater, Monroe Co.
Clearfield, Clearfield Co. Chambersburg, Franklin Co.

Channel C 155.505 Base/155.850 Mobile

Media, Delaware Co. Frackville, Schuylkill Co.
Phillipsburg, Centre Co. Rockview, Centre Co.
Dublin, Bucks Co. Schuylkill Haven, Schuylkill Co.
York, York Co. Hamburg, Berks Co.
Jonestown, Lebanon Co. ??? Bedford, Bedford Co.

Channel D 154.665 Base/ 158.910 Mobile

Montoursville, Lycoming Co.
Carlisle, Cumberland Co. (mobile units can be heard on both B & M
freqs.)
Ebensburg, Cambria Co.

Channel E 154.695 Base/156.150 Mobile ????
---
all barracks listed here have base and mobile comms. on 154.695 only
^^
Reading, Berks Co.
Hollidaysburg, Blair Co.

Channel F 154.920 Base/154.830 Mobile

Lewistown, Mifflin Co.

Channel G 155.445/???.??? Mobile
---
all barracks listed here have base and mobile comms. on 155.445 only
^^
Embreeville, Chester Co.
Newport, Perry Co.
Huntingdon, Huntingdon Co.

Turnpike F1---159.075 F2---159.045

These barracks are located along the turnpike proper, along with

maint. buildings. Other locations are maint. sheds only.

King of Prussia, Montgomery Co. (Police and Maint.) East-West Pike
Bowmansville, Lancaster Co. (" " ") " " "
Newville, Cumberland Co. (" " ") " " "
Somerset, Somerset Co. (" " ") " " "

Pocono, Carbon Co. (" " ") Northeast Extension

This list is in no way exhaustive. In fact, I work on it every
time I travel. Any additions are very welcome.
Other frequencies that are definitely used include the
following:

154.755---mobile to mobile
155.460---TAC-1
155.475---National (used to contact local PD's by radio...other times
they
will use the County dispatch, as here in Clinton Co.
where I go to school. In Delaware Co. and the Philly
area, they notify local PD's by phone.)
155.490---PA Regional net "CLEAN"
158.760---listed as Liquor Control Units or Administrative use in
various
sources. I have heard it used in Harrisburg as a car to car
private channel like the TAC-1 channel.

130. UBC9000 Price

Newsgroup: rec.radio.scanner
Date: 1996-08-02 00:00:00 UTC
From: Bob Schwerdtman <BOB9000@concentric.net>
Message-ID: <32027FA5.B4B@concentric.net>
Source record: 227795

The price for a European BC9000 called UBC9000 works out to about $510.00 and when it comes there is a duty. (mine was 27.37) so you can count on about $550.00 The only difference is that the UBC9000 has full cellular right out of the box. They also are shipped with no AC or DC power supply because of the voltage difference. So before you can listen you have to hook up some power.

: I see an article in the August US Scanner News about modifying the Pro-2030
: scanner that was recently closed out at Radio Shack. I assume the
: modification was for full 800 MHz.

: My PD is about to go Trunking, so I wanted to pick up a cheap one just for
: that purpose. If it can get full 800, great!

: I don't see it in this year's catalog, how long ago did they put it on $89
: closeout? Does anyone have a Radio Shack part number (I know it's not
: Pro-2030 for the smart alecs out there!), I'd like to see if I can get one.
: It sounds like a good deal.

If the mod says to cut L-201, then keep in mind that the later units can
not be done this way(the L-201 jumper is not even THERE).
There may, prehaps be a DIFFERENT mod for the later ones(but I've never
heard of it)
BTW, the 2030 is a reasonable unit-80 channels, but many gaps, and as
it's only double conversion, it does get the usuall images.
It's a good second scanner, but as a main(or only) scanner, you might
want to consider a better unit.
Also, in case anyone is wondering, it's a Uniden chassis.

>
To Alex:

What part of the universe are you talking about?

Several agencies in California do that: no access ... they
will just not program the radios.

San Francisco is installing a system which will be trunked
at first, but is digital-capable. I have not asked about
if they will allow radios for the press to be programmed,
but it will be interesting If they don't allow it. Already
one agency does not allow press access here in the Bay ARea.
have to listen to scanners.

I am sure that eventually an answer will be discovered for
figuring out how to open up Pandora's Box and make all press
happy....

Those agencies who allow it only provide the patrol channels,
as I posted before. The real talk, on tac channels is not
allowed to be programmed at their "INstall Ceremony"...

About two weeks ago in Ventura Co. So Cal. we had a dispatch
that wasn't funny but certainly got my attention. It was a
"car vs. airplane" I thought I was hearing things but when
all was disclosed an experimental aircraft (a Berkut) force
landed on the freeway short of the approach end of the runway
due to engine failure and "met" with a car. Aircraft
destroyed, car heavily damaged,but luckily no fatalities and
the pilot walked away.

Makes one wonder about airline equipment that is *so* sensitive to
interferrence. I would think it would be better built [shielded] than
that.

Perhaps this is the *real* cause of many crashes. I think I'll take the
car from now on... :)

Steve Work (slwork@netcom.com) wrote:
: Tiger X-term (t4) wrote:

First to ALL:

This post contains some good material. It also contains my response to Ron Katz who is unable to separate fact from fiction and who is bent on a continued attack on me and those things that are dear to me. The man lacks candor, and because of that, I have to deal with him.

/BC

ronkatz@interlog.com (Ron Katz) wrote:

>Just because it may be tuned up, does not mean its not causing any RFI
>Sparks cause a very wide band noise Billy.

Are you stupid, Katzenjammer, or do you just *act* that way?

>>expensive shielded ignition cables, but it's doubtful that would help
>>much.

>Its not much really to do with shielded ignition cables.

Ohhhh, it's NO act, I see. Well, Snigglefritz, shielded ignition cables DO stop the short rise time harmonic-rich RF that can emanate from unshielded cables.

> The less resistance the better actually.

Ohhhh geezus........Katz! Go to school, please. The lower the resistance, the better the antenna and its radiation characteristics. Good grief! The more series resistance, the lower the Q, and the less susceptibility to radiation.

> As you know electricity takes the
>least resistance to ground. Because of the large resistance in the
>sparkplug, if the cable does leak then current will flow through the
>air, to the engine, to other parts close to the leaky cable. This
>results in greater noise. Remember this path may be better then a
>gap of .0040"

And if it is an arc, there will be an engine performance problem, Ignats. Arcs radiate. If not an arc, then the resistance of the gap is plenty high enough to virtually STOP RF radiation, notably over the distance of the gap or path of an inch or so..... We're talking about "leaks" in the form of corona disharge and gas molecular ionization. Those leak paths are known to be low radiators. They can't resonate; the Q is too low. What on earth are you talking about and what CB book did you get that crap from?

>Resistive type wires lower the voltage which will also help but as
>soon as a cable starts getting old, dry etc. it becomes even worse.

In theory. In practice, there is very little difference in the
radiation characteristics of old or new cables. There is an engine
performance difference, though.

>By spraying water (mist) this reduces the resistance of the air
>makings it a better conductor of electricity. If you have a problem
>with a leaky cable, this will become more noticeable if wet. Why
>water? Well its basically harmless. If you run your hands along the
>cable you may have some shocking results!

If it ain't arcing, it ain't radiating, pal. Go to the textbooks.

>Oil will work the opposite. Oil is messy and in the long term if it
>is not cleaned afterwards then it can destroy rubber and may even
>ignite on a hot engine. If you find a suspected leak or break then
>you can spray some wd40 and see the difference.

Now there's an example of what I mean about utter imbecilic idiocy.
Are you trying to get the guy killed? WD40 is a very nice explosive.

>>Better still might be a magnet mount antenna installed as far to the
>>rear of the vehicle as possible, away from the engine area.

>>Are you powering the scanner from the vehicle's electrical system and
>>are you using an external antenna?

>>Try walking around the vehicle with the engine running (scanner and
>>its rubber duckie) and see how far away you can get before the noise
>>is lost. Get closer and see if you can peg the radiation point(s).

>Billy, most autos are made of metal.

So's your skull, Igor.

> The main source of electrical noise is from the engine compartments.

THAT is not exactly true. The source(s) are more likely to be from
wiring that carries the interferance and which can radiate. That
means length and proximity to less well shielded places. Rear ends
are great radiators. Roofs generally are not.

>> Are you willing to replace this guys scanner when he brings it
>> close to his spark plug wires and it get zapped by a possible
>> leaky cable? I think not.

You are stupid, aren't you? Get real, Katzenjammer. You're playing
games and you're playing the wrong ones for which you're prepared.
Would you like for me to find you a nice sandbox, chock full of
catturds for you to play with?

>Want to find some RF use a RF Meter If you must use a radio then
>turn it to a AM mode.

The gentleman is not likely to own whatever you call an "RF Meter", nor even know what one is. I don't. Nothing is called THAT to the extent that it is a recognizable term for colloquial use. "RF Meter" could mean anything.

HE didn't mention that he had an AM radio handy, either, Katz, but it is likely he has one in his car. He did not mention interference on it! THINK ABOUT THAT, stupid!

But the gentleman DID say he was getting interference on his scanner. Since it is a handheld, it can serve as a fine test instrument without plugging a spark plug cable into the antenna port. If he gets interference in the cab, then he can walk around the vehicle and get up to the engine compartment or even relatively down in it, without any risk.....and he can walk 50-ft away from it, too. One round of that exercise is likely to tell HIM a lot of what he needs to know. If not, it will at least tell him something to tell the forum, whereupon he can be steered to a solution.

> That's Amplitude Modulated Billy. Intelligence
>is added to a signal by the change in signal strength. "change in
>amplitude"

And THAT, my very stupid fellow is patently untrue! The very name, Amplitude Modulation, is a misnomer, and I see you've been suckered into believing the elementary version that's taught to imbeciles, third graders, and novice ham applicants, and others who show an aptitude for electronics and radio. But it REALLY isn't that way at all, Katz. Not even close. The classic waveform of an AM signal that you see in elementary textbooks and on o'scope screens actually does NOT exist. It is an interpretive or resultant waveform......

Lecture time. Get your paper and pencil. There will be a pop quiz later, Katzenjammer.

First....what doesn't happen. In a properly designed and tuned AM transmitter, the RF carrier does not change in amplitude whatsoever. It holds rock, solid, steady. The carrier contains absolutely no intelligence whatsoever. It does not vary.

Second....what does happen is that an audio signal properly MIXED with the carrier produces four frequency components: The sum of the mixed signals; the difference between the mixed signals; and each individual mixing signal. Say we "modulate" a 10 MHz carrier with a 1 KHz audio tone. The output of the modulator or mixer will consist of:

A. 1 MHz (carrier)
B. 1.001 MHz (upper sideband)
C. 0.999 MHz (lower sideband)
D. 1 KHz (audio signal)

Thirdly, since the modulator or mixer output is tuned and filtered, the audio component of 1 KHz will NOT be physically present. That leaves the output signal of a carrier and two sidebands. The strength

of the sidebands is directly proportional to the relative level of the original audio signal with respect to the level of the original RF carrier signal.

Fourth....at this stage of the generation of the signal, there is absolutely no difference from a single sideband (SSB) signal. But if the output is to be SSB, then the signal passes through a filter network that eliminates the carrier and one sideband. The moral is that there is no difference between AM and SSB signals at their point of generation. And, in fact, an SSB signal is also an AM signal. And AM is properly called Double SideBand Full Carrier. (DSBFC)

There are also varietals.....like DSBRC (reduced carrier); DSBNC (no carrier); SSBRC; and more.

>The noise your hearing is most likely not an FM signal or
>SSB etc. Its bursts of radio frequency signals. Bursts..On and off,
>stronger or weaker. ..hence the term AM

And you, sir, are fuller of shit than a Christmas Goose.

>EG. You will hear lightning from many miles away in AM mode then in

Aaarrrrrggggh! Lightning signals are a series of interrupted and varying carriers. There is no modulation on them.

>FM.

FM does not detect a carrier, dummy.

>>Report on results and maybe we can figure something out.

>Yeh, maybe. Thanks for your input once again, my engineer friend.
><grin>

>Thanks for your input Bill, I see your years of schooling has really
>paid off. Good stuff

And with you in the attack mode on my 30 years in the profession, don't you even dare wonder WHY I am all over you like stink on shit..... and will STAY there until YOU stop. And indicate that you have stopped! Look, KiddieKatz, YOU started in on me without provocation or good reason with your opening shot of:

Subject: Re: Bill's sore mouth & brown nose
Date: Wed, 24 Jul 1996 12:04:24 GMT

followed by

Subject: Re: Bill Cheeks is an asshole
Date: Fri, 26 Jul 1996 06:24:36 GMT

And I never knew of your existence until then. Want me to quote those two messages back for you and the forum here? I can continue with a track record of 13 more slanderous, nasty, scumbag posts from you.

Well, sir.....it's definitely your call. You accused me in e-mail of STARTING all this crap here. I compiled a timeline of what happened, who said and did what to whom, and the evidence is irrefutable. I did not start it.

And I did not even pitch my hat into the ring UNTIL 6 to 8 posts had been made slandering and attacking me. I said nothing to or about YOU in that period until after 7-26-96. It is ALL a matter of record and provable.

But with you having the sheer balls to lie about it and then to construe yourself a case on which to continue your vile, low life attacks on me.......I am commited to sticking with it until the fat gal sings. Your commitment and backup support better be as resolute and more accccurate than mine, because if it isn't, you will lose.

You're barking up the wrong tree, Katz. Or you made a bad choice in taking sides on 7-24-96. But if you continue to attack my art, my craft, my science, my integrity...you'll find yourself in a position of nothing to win and everything to lose. Save face and cut your shit right now. Call it a draw and a learning experience.

THAT is as good as it gets. Take it or leave it. But the terms are clear: say *nothing to or about me in any public forum*, and don't send me any e-mail of any type. You will receive exactly that from me in return.....GUARANTEED. ....until you break the contract (again).

Like it or lump it, pal.....

From: bcheek@cts.com
Message-ID: <32018b8e.97502914@192.188.72.19>
Source record: 227804

michael@alexander.terranet.com (Michael Alexander) wrote:

BC>> Good idea. Is EVERYONE up for a truce?

MA> Count me in.

Knock me over with a feather, but ok. Thing is, one bad apple spoils the barrel. And there ain't no getting rid of them all. Like John Mackey under his AOL screen name of

>>> bcheek4540@aol.com (BCheek4540) <<<

as well as under his own fake e-mail addresses. HIM, we have no choice but to ignore as we pursue other options. But not everyone can be conveniently ignored. Neither can every issue be ignored. Mackey can call me a fag all he wants. But if he forges my name and ID to a post, I'll stay on him until I take his head off and shit down his neck. Forgery is unacceptable. It will not make me go away. It will have the opposite effect.

There are other foundational matters on which I will not negotiate or pretend.

One is the kind of attack mounted by you (at one time) and even more aptly, by Hugh Duff and his partner, Tim Pacan. They went with both barrels on forgeries, mail bombs, slander, and an all out frontal assault on my livlihood, skills, education, and craftsmanship.

That......and anything resembling it.....is unacceptable. Do it and we will fight. Don't do it and there's hope.

I can be called a sonofabitch, an asshole, and a hundred other things so long as I ain't called late for dinner. I don't care about purely personal "attack" and flame. I don't take ME seriously. What I DO, though, is as serious as a heart attack. I will not idly stand by and have my craft, my art, my science, and my livlihood attacked. It's WHAT I do for people. To attack THAT is to attack THEM. And our hobby. I won't stand for it.

Neither am I freely open to attacks on my choice of posts. My hobby and my livlihood are inseparable. You and many others may not understand, but I can't help that. I am not a "dealer" or a "store" or a "business" in the conventional sense. I am a radio hobbyist, radio engineer, radio writer, and tough shit if some don't like it, but I -=am=- also a radio and electronics expert in a practical, non-hornblowing sense. You don't DO something for 30+ years and not be good at it.

It is not possible for me to "hide" or suppress one side and not the other. On the other hand.....I am conscientious and ethical with respect to the conduct of commerce in a hobby forum. I am not here to do "business". I am here to support the hobby; the arts; and the sciences of radio. Now when I see Optoelectronics' and Uniden shills in grand profusion, operating with utter impunity here, you can bet your sweet patooty that I am going to feel free to tell it like it is, one way or another. Once in a while, one of those ways is going to involve a product that I developed or introduced or wrote. Tough.

If the Optoelectronics interfaces are common knowledge and open for discussion here, it is partly thanks to their shills, party due to their advertising blitz, and partly due to basically good products.

Well, I have no shills; I can't afford the advertising campaign; but I do have a good product or two or three.....and some of 'em are downright FREE; others carry a cost/profit deal. It is not possible to distingiuish among them in all cases. If someone wants to know the cellular mod for a PRO-2006, hey dude, pop the top and clip BOTH diodes behind the #3 key on the front panel....right there in plain sight. But if another dude wants to stick 25,600 memory channels in his PRO-2004, I'm going to tell him that 50+ pages are dedicated to that hack in one or more of my books....and he'll need to get them, along with a Tandy Service Manual and a few other things....that can be had anywhere but from me. I don't care where people get stuff.

If someone wants to know about computer interfaces for scanners, I'll tell 'em! I'll tell 'em about the Opto units; I'll tell 'em about Datametrics (RIP?), and I'll tell 'em about the CE-232, a perfectly acceptable alternative to the "big boys'" product.

And I am NOT going to be attacked for it.

Some may think I am new here and don't know the ropes. If so, that would not be correct. I know the ropes because my hobby and my business have been entwined for over 30 years. I was networking long before I popped on here last year to face up with Andy Moss.

I conduct myself according to a personal set of standards that has evolved over these 30 years. And I will not be open to attack for it. Neither will I sit around and be COMMANDED on how to "behave" when corporate shills, hypocrites, and slugs are fast at work here right under everyone's noses.

I understand that you and others may not agree. You and others must understand that I may not agree. We live with it, or we fight. For one thing, there is the principle of the squeaking wheel getting the grease. Well, the vociferous minority here raise a cacaphony to beat feeding time at the zoo, but they ARE nonetheless, the minority. I will neither condescend to nor obey a cacaphony, much less a minority.

That, as a given, then it must also be understood that this virtual forum is NOT a town square where "might is right", and where a mob can freely exert its will. THAT has been proved.

I possess a Power of One that can withstand all assault, from legions to squads; from Kings to snotballs. NEVERMIND that YOU and everyone else in this forum ALSO possess that same Power of One.

Some choose to exercise it; some don't. Either way, it is a personal decision.....a decision of freedom and liberty and American Value. American Values, my ass, it's Human Values.

I'm talking about nonsense issues that people do not have a right to force on others. Sure, we should try to stay on topic here, but when there is drift.....as there ALWAYS will be......just who gets off mail-bombing the "offender"? Who's to judge what's on or off topic other than the poster himself? All I know is that my FIRST post here a couple of weeks ago was......ON topic.

I don't abide kangaroo courts, self-appointed judges; self-annointed messiahs; and waltzing preachers. Geezus, THIS is a virtual forum, for Pete's Sake. Everyone has a <N>ext and a <D>elete key. And everyone has a choice of software, too. Some, if not all, software allows the user to choose what he downloads. Then there's killfiles, and a host of other weapons and tools at the disposal of every one of us. We have no business leveraging "force" on others, especially negative, emotional forces where the best solution is right there in the hands of the user.

Ol' Ronnie Katz took it upon himself to drop off a boatload of e-mail bombs at my mail box. He snivels that I was off topic and that he didn't want to read that stuff. Fer the love o'Pete, look at the message queue of this forum where there are 17 posts from him with 15 of the damn things off topic as all get-out. So not only does he fail to practice his preachments here, but the hypocrite calls for a public e-mail bomb on me and then tries his hand at it, too. Ok, ok, ok, now listen carefully....THAT is unacceptable. Intolerable.

-=IF=- ignoring a problem is supposed to make it go away, how's come people DON'T ignore it? Especially the vociferous minority? The ones who preach and snivel the loudest?

Truce? Cool. But it ain't that easy, unless it's JUST betwixt thee and me. I can deal with you. You can deal with me. WE cannot deal with the entire forum. I'm all FOR leaving you the hell alone anyway; one less name to type when I'm talking about snotballs and sickos. (I'd be glad to know you're not one of 'em, if nothing else.)

I'm all FOR you introducing your new book(s) if you want to. I'm all for WINRADIO announcing and introducing their products. I'm all FOR reasonable excesses of any sort in this VIRTUAL forum.

I'm all FOR you questioning the accuracy or truth of what I post, so long as THAT is what it is, and not a sublime attack. If I say something ignorant like I= R*E - hell yes, ask me about it. It may have been a typo. I may have been careless. Or if I were stupid, then I might smarten up a little.

There are plenty of ways to challenge issues without challenging the person. But come galloping in on a gallant horse with a messiah's handbook in hand, challenging me and my right to live, well hey.... I fight back. THAT ain't going to change. But I can forge a truce with YOU. You tell me what you want....speak FOR yourself only, and I'll tell you what I want, speaking for myself only, and if we agree or negotiate a few little sniggles, then we have a deal. It doesn't get any better than that.

I do NOT set rules for others to live by; neither will others set rules for me to live by.

Aside from issues of moderation and temperance, so to speak, I will NEVER be the aggressor; I will NEVER start a brouhaha; I will NOT initiate the tasking of others for their choice of posts. If someone posts something that does not interest me, I ignore it. If I post a FAQ and someone doesn't like it, he can ignore it, too.

I dunno.....between you and me, ok. But if Katz leaps through his sphincter to have a go at me again, I'm gonna thump him without worrying about yours and my truce. If Katz wants a truce, he can come deal for one, same as you and I are doing. There aren't all that many truces needed, anyway. Duff and Pacan are gone. Boe and I see eye to eye, I think. You and I might soon..... Mackey doesn't count.

Now there are a few kibitzers and hooters in the grandstands, but I don't see them keeping it up. Katz and a couple of his goodbuddies are "on" right now, but I'll take care of them fairly quick if uninvolved people stay uninvolved.

And if scanners and scanning are what this forum is all about, then let's get on with the program. We've got some work to do. Scanning's days are numbered unless we figure something out. The government will see to it, if nothing else does. Governments don't like us to listen.....

Sorry for jumping in the middle of this, but I use a cut down TV
antenna to recieve the seismic data links in our area. They are on
167.1950, and transmit a steady tone. When the earth moves, the tone
varies. I read the signals with a Radio Shack multimeter with a
computer interface. The signals are horizontally polorized, so the TV
antennas work just fine. I just cut off the longer elements. These
antennas, can, of course, be vertically polorized and used for
scanners with great success. :-]

I have not experience with Scanstar, but I owned Scancat, which I used
with my AOR8000. What I liked about it was that it had features especially
for the AOR8000 (among other scanners) and that made it easy to program
the scanner without a lot of fuss. What I didn't like about it was the
interface is quirky and outdated in this Windows kind of world we live in.
CAT, the company, was very good on the support end and that's worth a lot
these days too.

Does anyone have recently confirmed, accurate frequencies for the Dade County area? Seems that the long lists of local, state and federal freqs. that are listed in books, web sites, and such places yield little other than silence when listed to ....please send any currently valid freqs. to group AND author by reply e-mail please.

Subject: PRO-2026 MODS!!!
Date: 20 Oct 92 14:55:50 GMT
Organization: Rutgers Univ., New Brunswick, N.J.
Lines: 29

Hi all, just got these mods, hot off the FAX!

Note: It is not lawful to monitor cellular or conventional mobile
telephone conversations.

The 2026 has cellular frequencies deleted at the factory, but
restoration is the easiest ever! - clip one marked wire! All you need
is a Philips screwdriver and wire cutters.

1. Turn the scanner upside-down and remove the four side screws
holding the bottom cover in place; pull the cover loose and set it
back about two inches out of the way.

2. Locate the small circuit board at the lower right-hand corner and
find jumper L201. Cut it and slightly separate the break.

3. Reassemble the radio which now has continuous 806-956 MHz coverage
and 30KHz search increments in the cellular band.

*** I have not tried the above mod, but did acquire it from a
commercial radio dealer who is very respectable, so as always, proceed
at your own risk and realize that this will violate your warranty!

Have Fun!

>Scancat...and of course the indispensable reasons why.

tim - I have the scanstar for windows (whatever the latest edition is)
and I like it alot. nifty interface, imports DBF files right into
it.....

a lot of people out here like that dos version of (can't remember
now...does all the same stuff, but scans faster..)

Anyway - scanstar is nice BUT still has some bugs.

Big peeve is that say you have 5 banks listed, and 4 show locked out
(the little check box by each frequency is red, not green). If you
exit the program and come back in, everything LOOKS the same....BUT,
if some of those lockouts are SEARCH RANGES instead of frequencies, it
still scans them. If you get the properties of that range, there is a
check beside SCANNING even though it shows RED for locked out.

the work around is that you have to hit the big reset button, and then
select just the range you want to hear.

other than that, seems to be a great software. No GPF's, no lockups,
and will work in windows 95 if you are so inclined.

Even with the little glitch (which once you know it's there, ceases to
be a problem) the other features make this a great program.

The really cool logging of searches, DTMF, all that other nifty stuff.

love it!

I've only seen those signs up during the Dayton Hamvention time
period, and the signs were all portable. I therefore assume that the
problem of the AFM being infested with inconsiderate boorish hams loudly
transceiving only occurs during the Hamvention time.

Maybe someone shoudl contact the AFM & ask what the deal is -- might
make for an amusing article in one of the ham magazines.

I don't recall the sign(s) mentioning scanners/receivers at all.

Do scanners emit much or anything in the microwave region? With cellular phones there was that controversy over whether antenna emissions caused any harm. Even the manual to my cellphone mentioned not to touch the antenna while the phone was transmitting, and not to hold it such that the antenna was within three feet of another person (of course its much closer than that to the user's head...)

Is there a problem with carrying a scanner on your belt, or coming into contact with the scanner? Of course any emissions are doubtlessly less than the 0.6w to 3w of a cell phone, but then you don't generally transmit for hours at a time on a cell, while that amount of time wouldn't cause you to pause twice with a scanner.

No worry here - scanners don't use the antenna to transmit, they just receive.

-Carl

p.s. before all the "Your wrong you idiot" posts start let me add this caveat: scanners do contain a REALLY SMALL transmitter called the local oscillator. The output from this component is really weak, is +/- 10 or so MHz from whatever frequency you're scanning, and is not hooked up to the antenna anyway.

174. Re: Why Cops use trunked systems...

Newsgroup: rec.radio.scanner

Andy,
Please clarify what I said. I never stated the media would boot city council out of office for getting a trunked system,
I said we would give favorable press to the responsible persons that authorized media to purchase at their own expense trunking radios with rec. only capablitilty.
All the other arguments are moot.
Without the ability to cover news we cannot cover news. This means no viewers(readers) =no advertising= no money coming in.
As I said before. Mayor Andy said the media cannot have access to the radios.
Candidate John makes a point to put it in his adgenda to have us equipped.
Who do you think the media will support.

That is not extortion. Extortion is when I go into your office and tell you to give me a radio or I will print negataive things about you.
As far as the media is converened. YOU may be the best mayor in the world. Get along with unions, keep the city in the fiscal black, promote tourism * Comerce etc BUT you do not agree with us. You are costing us money.
WE will support the other guy.
If you want to give us trunked radios then obviously we will not begrudge you quite so harshley(sp) <G>.

Well, if the fixture is a table lamp, it's real tricky to install it into PRO2006 (it will work, however).

Opto has a sale on the OS456 for around $200. Best price they've offered (which I assume means they're blowing them out because the market is drying up, so if you or anyone else thinking about adding computer control to their 2006, now is probably a good time to decide one way of the other).

> Thanx. Grntx Ray.....

i just replied on a simular message recently, here is it again,
same problem, maybe same solution ?

i just repaired one earlier this week with the same symptoms.
a capacitor was leaking on the top board, i think it was a 220uF 16V cap
near the bottom side of the PCB.this is in the circuit of the 5 volt
stabiliser input, i measured a short there and traced it to the cap.
after replacing the cap, i still had problems because the voltage to
this circuit is switched by the cpu, the transistor that was switching
was dead (located on the bottom board near the connector), i just shorted
the E and C because i couldn't find any info on this transistor, it works
,the light is back, the sound is back
i didn't have the circuit diagrams but i think the cpu switches this
circuit for mute reasons ??

I have an BC-890 with the tone board installed. Any audio coming on a channel with CTCSS enabled that doesn't have the correct CTCSS encoding is ignored. In other words, during scan or priority check, it doesn't stop on that channel. I had to install the tone board because a neighboring fire dept. and airplanes were bleedinging in on my departments freq. and waking me up at night.

>>the whining noise, it's more like crackling. It's not strong enough to

Whining noise is a sign of a higher frequency device switching on and
off like a blower motor, or in most cases a diode in the alternator.

Crackling is most likely arcing your hearing. (sparks jumping
somewhere)

>>break the squelch, but when a distant, weak signals is picked up, they
>>are drowned in the noise.
>>
>>It's tune up time again, but last time I did a tune up, I used resistor

>>liter V6?
>
>Chances are the car is as tuned as it can get.

Just because it may be tuned up, does not mean its not causing any RFI
Sparks cause a very wide band noise Billy.

>expensive shielded ignition cables, but it's doubtful that would help
>much.
>

Its not much really to do with shielded ignition cables. The less
resistance the better actually. As you know electricity takes the
least resistance to ground. Because of the large resistance in the
sparkplug, if the cable does leak then current will flow through the
air, to the engine, to other parts close to the leaky cable. This
results in greater noise. Remember this path may be better then a
gap of .0040"

Resistive type wires lower the voltage which will also help but as
soon as a cable starts getting old, dry etc. it becomes even worse.

By spraying water (mist) this reduces the resistance of the air
makings it a better conductor of electricity. If you have a problem
with a leaky cable, this will become more noticeable if wet. Why

water? Well its basically harmless. If you run your hands along the cable you may have some shocking results!

Oil will work the opposite. Oil is messy and in the long term if it is not cleaned afterwards then it can destroy rubber and may even ignite on a hot engine. If you find a suspected leak or break then you can spray some wd40 and see the difference.

>Better still might be a magnet mount antenna installed as far to the
>rear of the vehicle as possible, away from the engine area.
>
>Are you powering the scanner from the vehicle's electrical system and
>are you using an external antenna?
>
>Try walking around the vehicle with the engine running (scanner and
>its rubber duckie) and see how far away you can get before the noise
>is lost. Get closer and see if you can peg the radiation point(s).
>

Billy, most autos are made of metal. The main source of electrical noise is from the engine compartments. Are you willing to replace this guys scanner when he brings it close to his spark plug wires and it get zapped by a possible leaky cable? I think not.

Want to find some RF use a RF Meter If you must use a radio then turn it to a AM mode. That's Amplitude Modulated Billy. Intelligence is added to a signal by the change in signal strength. "change in amplitude" The noise your hearing is most likely not an FM signal or SSB etc. Its bursts of radio frequency signals. Bursts..On and off, stronger or weaker. ..hence the term AM

EG. You will hear lightning from many miles away in AM mode then in FM.

>Report on results and maybe we can figure something out.

Yeh, maybe. Thanks for your input once again, my engineer friend. <grin>

Thanks for your input Bill, I see your years of schooling has really paid off. Good stuff

190. RCM-KS for August

Newsgroup: rec.radio.scanner
Date: 1996-08-02 00:00:00 UTC
From: andyb@qni.com
Message-ID: <4trnc1$i6a@suba01.suba.com>
Source record: 227923

This is what would have been the August RCMA KS column.

August 1996

Friday, April 12th, I found a previously unused, undocumented frequency. Normally such an accomplishment is accompanied by bragging, chest pounding, and other infantile displays which are performed in order to show oneï¿½s feeling of personal omnipotence. Of course, I was not so subtle. My immediate concern was to brag to Bob KS-001, who routinely unearths such information before me. My wife was in mid blink as I left the room to make the phone call to him, so she completely missed my exit. Anyway, the frequency is 867.3375 KNNJ875 licensed to Douglas County Sheriff. Detective work revealed that Douglas County has been testing the equipment, and that it will most likely be their dispatch channel in the future. Douglas County dispatch and mobiles already have the ability to talk with troopers and dispatch on KHPï¿½s new 800 system, so it makes sense that they would go 800 for their own communications. It should eliminate the need for a low band radio and an 800 radio in each car.

My point of going overboard about this discovery is to illustrate that anyone can stumble across something like it. Patience is the key. In this case I searched from 866 to 868.9875 MHz for weeks until the frequency came to life, and then spent several days listening to it. The NPSPAC manual indicated it was licensed to Douglas County (see February ï¿½96 column) so I called them and they were able to confirm it. Those of you who are fortunate to have several scanners could dedicate one to a search while the other radio scans your normal frequencies. If you canï¿½t identify something you discover, drop a note to me and I will try to track it down. I have lots of contacts with fellow dispatchers around the state and can often get answers to hard questions.

This might be a good time to recap the Kansas 800 system, and what has been discovered so far. Kansas is developing a statewide 800 MHz system for all state agencies...KDOT, KHP, KBI, Fish & Game, etc. It will be a quiltwork of different types of sub-systems including:

1. New trunked systems licensed to the state.
2. Existing trunked systems owned by other agencies on which the state is allowed to "piggy back."
3. Trunked and/or conventional repeaters in the NPSPAC frequency range.

To complicate things, NPSPAC (National Public Safety Planning Advisory Committee) has dished out the 866 to 868.9875 range for ANY Kansas agency to use...state, county or local. If you have read some of the Kansas columns, you probably noted portions of NPSPAC frequencies routinely listed there. Since all the agencies involved may allow other

agencies on their systems (primarily on trunked systems), you will never know just who may pop up on a frequency. Here are some of the known frequencies for the state, as well as some NPSPAC frequencies for non-state agencies:

ï¿½ 856-860.4875 KS state trunked system in Topeka
Shawnee County agencies, KHP, KDOT, KBI, etc.
ï¿½ 856-860.7125 KS state trunked system in Manhattan
(havenï¿½t heard from anyone out there who can confirm this one yet)
ï¿½ 856-860.9625 Johnson County trunked system
Johnson County agencies, KHP
ï¿½ 856-860.7625 Kansas City KS trunked system
KCK all city services, KHP
ï¿½ 856-857.7125 Ellis County trunked system
Ellis County agencies, KHP
ï¿½ 856-860.2625 Sedgewick County trunked system
ï¿½ 856-860.4625 Sedgewick County trunked system
ï¿½ 856-860.7375 Sedgewick County trunked system
ï¿½ 856-860.9625 Sedgewick County trunked system
Sedgewick County agencies, Wichita agencies, KHP
ï¿½ 866.0125 Mutual Aid
ï¿½ 866.5125 Mutual Aid
ï¿½ 866.6750 KHP Bonner Springs
ï¿½ 868.6750 KHP Eskridge (Topeka area)
ï¿½ 868.1750 KDOT Bonner Springs
ï¿½ 866.1000 KDOT Olathe
ï¿½ 866.7125 KDOT Osawatomie
ï¿½ 866.9750 Unassigned in NPSPAC manual
KDOT type traffic heard (Donï¿½t know if this is a good one or not. Will keep checking.)
ï¿½ 867.2000 KDOT in Waverly
ï¿½ 868.8625 KHP in Lawrence
ï¿½ 866.6875 KHP Olathe
ï¿½ 868.9250 KHP Corning
ï¿½ 867.3375 Douglas County

Keep those scanners searching the 866 to 868.9875 range and report what you find. It looks like the Kansas system is coming together quickly, and we need all the reports we can get.

As promised, more NPSPAC frequencies are to follow.

Jackson County 866.2000 Jefferson County 866.2375
Jackson County 866.5375 Jefferson County 866.4875
Jackson County 868.5000 Jefferson County 868.4750
Jackson County 868.7500 Jefferson County 868.7250
Johnson County 866.2625 Johnson County 866.3375
Johnson County 866.3625 Johnson County 866.3875
Johnson County 866.5375 Johnson County 866.6125
Johnson County 866.6375 Johnson County 866.6625
Johnson County 866.7875 Johnson County 866.8875
Johnson County 867.8250 Johnson County 868.1000
Johnson County 868.1250 Johnson County 868.2000
Johnson County 868.3500 Johnson County 868.3750

Johnson County 868.4500 Johnson County 868.5250
Johnson County 868.7000 Johnson County 868.7750

Till next monthï¿½

Andy

Actually, a tv antenna is already mounted for horizontal polorization.
Turning it sideways it putting it in the vertical plain and most stuff
you want to scan is polorized that way.

EL>Ed

The knobs suck. The on/off/volume wears out the fastest. Rotate the
knobs around. When the whole set is bad, you can get replacements
for a $1 a knob. Me, I just gave up for now and let the radio
go naked.

Rules I know are 'No devices below 10k ft," then limited to a a list
which may not allow certain cd players, games, etc, thought to be
potential interference sources.
Current reg's allow for the airlines to set policy. I think the
general policy is to follow the guidelines above.

However, the captain of the plane has the ultimate ability to more
restrictively regulate the use of devices on the plane. There are
also rules about obeying orders from the flight crew, whioch could be
interpreted to mean that the flight attendant makes the decisions,
too.

Hey Bill I ma getting many, many laughs from the postcard you sent.
hahaha

Thanks again.

Even though you did not send a return address it is OBVIOUS that it came
from you
since you said "eat my shorts" & it has a return address of San Diego
(where you live).

IT's really a riot BIll. Thanks.

146.005 is assigned to the Amateur Radio 2 meter band.
You may be picking up beacon stations.

No repeater inputs or outputs are assigned to this frequency. It is
more likely that these are beacon stations. I don't hear anything on it
in Fort Myers, Florida and no carrier there stops my scan.

ANNOUNCEMENT
Shortwave & Radio Catalog
of Hypermedia Links
http://itre.ncsu.edu/radio

Shortwave / Radio Hypertext Catalog on the World Wide Web (WWW)
serving the radio enthusiasts since March, 1994

AVAILABLE ON-LINE NOW
ISSUE #41

An on-line catalog of hypertext links to FTP, GOPHER, and WWW files and services for the Shortwave Listener and Radio enthusiast is now on-line. This issue includes links to broadcaster schedules, digital audio files, graphics, mediumwave, shortwave, FM, Ham Radio, FCC, and other files associated with radio.

Over 1000 hypertext links (and still growing) are listed. These include direct links to Shortwave, AM, and FM broadcasters, Solar reports and images, Scanner information files, audio files, internet broadcasting, ham radio info, radio reviews, info for the novice and much more. All these available with a click of your mouse via Netscape, Internet Explorer, or whatever browser (return key for NCSA lynx users).

The URL to put in your hotlist/bookmark file or Home Page:

http://itre.ncsu.edu/radio/

* What's on Shortwave? *
A Beta Test (0.4) "What's on Shortwave?" interactive WWW form
that browses an experimental shortwave broadcaster database
over the internet. Features include "What's on now!", "What's
on at [time]?", "When is [country] on?", "When is [station] on?
Who is on [this frequency]?

** MUF/LUF **
Maximum Usable Frequency, E-Cutoff a.k.a. Lowest Usable Frequency Charts

I have a WWW MUF/LUF tool based on "micromuf.bas" on-line. Fill out your
location, transmitter location, and sun-spot info (links to solar info for
the day, week and month available from the web page.) and an ASCII, WWW, or
even a .GIF MUf/LUF propagation chart graphic file will be returned. Try out
this interactive World Wide Web form.

Toward the Future

If you have a site or know of a site that maintains up-to-date information
on radio topics, send me e-mail.

If your club would like to participate, (provide program schedules, club
events, maintain files on individual broadcasters, etc.), send me e-mail.

If you are a radio broadcaster and have internet ftp files, gophers or WWW
servers with program schedules, audio-on-demand files, or other information
to share, send e-mail to:

It is Later.

You can only get the other out of band freq's with the keyboard mods. You
can get the images of cell calls starting at 896.0000 Mhz and scanning
up....

Ive noticed staff in Kmart stores in Adelaide, Australia using mobile phones.

Does anyone have any info on how these work etc etc? Are they like
mobile phones or are they like an internal phone system or 2 way radio?

I believe they operate on 859mhz.

Thanks

>frequencies are used for different parts of the airspace, not necessarily
>a particular runway.

Since PATCO was fired by President Reagan, there has
been a lot of consolidation of ATC responsibilities. Many
airports have Approach/Departure Controllers working the
various sectors of their airspace. When you're outbound in
the sector, the controller is doing Departure work and when
you're inbound in the same sector, the same controller is
Approach (or Arrival).

During low traffic/light staffing hours, operations
are condensed so that multiple sectors and/or operations are
simulcast on the corresponding channels. Tower and Ground
control are often simulcast at the airport in my city.

> As to the abbreviations:
>VDF - VOR Direction Finding service (VOR = VHF Omnidirectional Range)
>GCA - Ground Controlled Approach
>PAR - Precision Approach Radar } An entry would indicate that instrument
>SAR - Airport Surveillance Radar } approach minimums apply.
>SRE - ?

Airport Surveillance Radar = ASR
SAR is Search and Rescue

Also - PAR is military and ASR is civilian.
Otherwise they are pretty much the same thing.

>he did expect privacy, would his expectation be reasonable?

According to the New York State Court of Appeals
(our highest court; the NY Supreme Court is one level LOWER
for some reason), an expectation of privacy is reasonable
using even a cordless phone. That was the reasoning they
used in upholding NY State law against monitoring of
cordless phones that predated ECPA. Now that cordless has
been added to the federal law, the NY law is probably
preempted anyway.

Most likely AWACS due to the two-word callsign. The
only AWACS calls I've heard have been DRAGNET [something],
but I haven't done any serious milair listening in a while.

>309.5 - AWACs stuff with BACKBURNER, CHALICE DELTA

Another new callsign to me. It might be a temporary
one for the exercise being used by HUNTRESS.

>Is this the proper newsgroup for this type of stuff? I haven't seen reports
>like this in the times I've been here.

I suppose so. I mean, if you can't think of
anything really nasty to say about certain other newsgroup
participants, I guess you might as well post some scanner
frequencies. [very big grin]

I don't have the buttons, but I can clarify that the
"Cobras from Syracuse" are F-16s. We do have Cobras (and a
few Hueys) flying out of Rochester, using the callsign
BLACKHEART (formerly ROUGH RIDER).

>

Amen, Roy!

Bill has done quite a bit for this hobby. I have learned alot from Bill Cheek
, Bob Parnass and those like them. I would hate to see this information stop.
After all, isn't that why the Internet and BBS's were originally started.

People who show any kind of disrespect have forgotten or never learned about
common courtesy. If you don't like someone's ideas, that's fine, Don't pay
any attention to them. If you want to respond to these ideas with your own,
offer intelligent reasons why you disagree, not resort to name calling.

I find that these flamers do this because they themselves have nothing of
value to offer this group, but so desperately want to participate. My
suggestion to anyone, is if they notice the same people involved in this
practice that they filter these people out - Problem solved.

I appreciated your post.

YEP!!! In those days, ANYTHING that was not strictly stock did the
same thing. BUT, I'm talking about a strictly stock, out of the box
Ford. It was basically, and inherently RF noisy, compared to other
stock cars. And yep, we tried all of the braiding of trunks and
hoods, even built tuna can covers for distributors, and shielded the
coil and plug wires.
I admit that newer cars today may present different problems, but Ford
is still basically noisy!

225. Wireless Mics

Newsgroup: rec.radio.scanner
Date: 1996-08-03 00:00:00 UTC
From: kamst39+@pitt.edu
Message-ID: <4tvt5u$hg3@usenet.srv.cis.pitt.edu>
Source record: 227658

Yesterday, I was at a local mall for lunch. A radio station was there giving away some prizes, doing the whole promotional thing. I noticed that the DJ was using a wireless mic, so I turned on my scout, and hooked up a 16" dual-band whip. This antenna has a couple db gain on VHF and UHF. The DJ was on the first floor, and I was on the second floor. My scout wasn't picking anything up, so I decided to get closer. I ended up getting so close to the mic, actually around 3 or 4 feet. The scout was concealed in a big, but the majority of the antenna stuck out of the top. Despite being so close, nothing.

Scout didn't pick up anything so I tried scanning some of the popular microphone frequencies to see if I could find it. No luck there either. Now I didn't have the list of freq's in front of me, so I was scanning a range.

I've picked up other VHF signals with my scout more than a few feet, even low power transmitters.

Do the majority of wireless mic's operated on approx 169mhz-171? Are they any kind of 'spread spectrum' or digital mic's in use? I'll list the freq's I currently have below, please add any I'm missing.

The only other thing I could think of to improve my chance of getting a hit on the scout, would be to buy/make an antenna thats designed expressly for the range I'm looking for.

Wireless Microphones: 169.445, 169.505, 170.245, 170.305, 171.045, 171.105, 171.845, 171.905.

Thanks.
Keith

>
> OK, what sould I waste all that money on??????
>
> Thanks!

Tony,

I consider the 2006 the better for the simple reason of expandability.

The PRO-2006 come with good standard features. The fact that the 2006 can be expanded makes it the better choice. I don't know mucch about the UBC3000XLT, but with the 2006 one can add more channels, (64k approx) computer control from various dealers, various signal strenght and
and other meters.

The PRO-2006 is a little tight on space inside the cabinet, but worth the extra effort.

I did find by coating the inside of the case with a spray designed to reduce RF, it improved
my sensitivity (or interference) greatly. I started to try the foil method, but just didn't trust my overall workman ship for such a delicate job.

If you shop and bargin a little, you can find an unmodified 2006 between 250-300.

If I remember somebody was doing a survey either here or on the scanner listserv. Maybe that
person will step up and confirm his findings.

I like the PRO-2006 for the simple reason that spare and replacement parts are readily available.

Plus tons of written material and support are available for the unit. Face it, everybody knows
something about the 2006, with that many people have very little to great experience with the
unit means that it has a good following.

>Mr. Cheek has readily supplied both. Thanks Mr. Cheek.

Thank YOU for saying so. I really want to be here for not only answer-giving, but to GET answers and to pick up on market turns and demands, and to blend other input into a composite picture of where scanners and scanning are going in the future.

For all intents and purposes, scanning is on shaky ground as more and more services are going to Internet or related connections. Some are going satellite. Some are simply encrypting their signals. It won't surprise me if before too long, baby monitors are encrypted or put onto spread spectrum.

In other words, there are a lot of unknowns ahead, and things don't look so well, so I'd much prefer to attend to the technical and hard core side of our hobby than to engage in pissing contents with sickos and malcontents. I think we can get there soon enough. Some people see me as the "new guy on the block" and want to extract some taxes and dues. Soon as they understand that I paid my dues a long time ago and ain't paying any more, things will perk up. They always do.

Sounds like you have an interesting history, and I don't mean that negatively. I've followed some cases like the Legion Of Doom et al, and was intrigued. Clearly, you've paid your dues.

Glad to know ya!

Bill

What scanner do you suggest me if i want a pre-used scanner for 250-300$ that:

- can cover from about 500KHz or less to more than 1300MHz?
- I dont need the pc stuff gadgets that only boost the price of the scanner
- it can be at least cell restorable

PLEASE HELP ME ON THAT ;-)

>>First, the givens. NiCd and NiMH cells need to be promptly recharged
>>to full after each use.

>Why? What happens if they aren't?

Remember the legend of the "memory effect"? Well, THAT was disproved,
but there was a reason for its persistent propagation. Exactly what
it was, I don't remember, and don't have the time to research it in
detail at the moment. Something about the internal chemistry being
more active at a low state of charge than at higher states.

I will try to look more into that for the sake of knowing, but for
hobbyist applications where in-depth engineering is not at issue, the
rule of thumb to keep your batteries fully charged is a good one.
After all, you may not have time to charge them when an emergency
occurs.

>Lead-acid cells are damaged by storage in a discharged state.
>I've seen no convincing electrochemical explanation for such an assertion
>about NiCd cells.

NASA Technical Journal.

>>To discharge a cell below 1.0v is to risk permanent damage to the
>>cell.

>Why? What happens if you do?

Again, chemistry. Not to mention increased internal resistance of the
cell. But I'll see if I can learn more about exactly what.

>The more common useage of this statement I've seen is that it is unsafe to
>discharge a series-wired nicad PACK to a total voltage which would imply
>less than 0.95 - 1.0 volts per cell. At that point, a nicad cell is about
>95% discharged, and voltage falls rapidly - so much so that you risk
>sending it into reverse charge as the rest of the series pack feeds
>current through it.

That is a definite risk, and possibly the more important reason to set
1.0v as the lower limit. On the other hand, as a cell discharges, its
internal resistance increases at a non-linear rate. That means at
some point I-squared-R losses start to mount inside the cell. Well,
I-squared-R is POWER or heat, and heat is known to accelerate the
decomposition of the chemicals inside the cell, causing permanent
damage.

The mA/h rating (or less) of the cell down to 1.0v is known to NOT cause excessive heat buildup, but below that point, there is probably a "knee" in the curve.

>But what damage is done by discharging a naked cell to zero?
>Explain, please ... be technical.

There you have it: I-squared-R losses escalate as the cell resistance increases. If you decreased the current flow as a cell dropped below 1 volt, perhaps it *could* be safely discharged to zero, but that is a misnomer, for the same reason that a car will never run into a tree, if with each unit of time, its distance from the tree decreases by half. Besides, that analogy would not be practical because current demands of electronic equipment are fairly consistent, and as current decreases, so does the supplied voltage, to where eventually there is "regulator dropout" and the unit goes dead for all intents and purposes.

I think people trying this little "get-rich-quick" scheme have a better chance at making money by sitting under CP's Corkscrew Helix and waiting for money to drop out of people's pockets...

BTW: interesting story... Last time I was on Corkscrew, I sat in seat #3. Some moron from seat #1 releases a quarter while going down the first hill. It was pretty cool -- I just reached out, and the quarter floated into my hand... Okay, so I'll refrain from responding to these silly posts again...

I went there in June and smuggled in a handheld withen a hippack. Even had a clip on speaker attached to it. I never had any problems and it was great. Parades were fun to listen to , knowing when Main Street would be congested and Fantasmic would draw the large crowds. Thats when you hit the major rides. I thought Maintence, Parade, Fireworks, and security were Number #1 to listen to. Monorail and Train were a bore along with Hotel Security, and submarine ride. Check out Beyond Police Call from the Shack. Special Event nd System Detail in the back section lists it all along with some in the California section.
Good luck and have fun!

OBO is short for Ohmorphic Basal Orthontagonal. OBO is a wonderful feature
in high-quality scanners. It helps reduce spurious emissions during the
day time and nocturnal emissions at night.

>

I've owned both and from where I sit, this is apples and oranges. You're comparing a base scanner with a handheld! There are obviously pros and cons to each. If you want to go a race track and monitor freqs, the 2006 is the worst scanner in the world for that purpose unless you're also packing a generator. If you want computer-control, then the BC3000 is on no value.

Ask yourself: What do I plan to do with it? Then decide which one is better.

Firstly, thanks for posting this Bill. I understand some of it, but you've gone a bit too technical for me. Therefore I'll just have to ask simple questions to you:

I have an AR8k scanner, and it currently uses 1.2v 700mAh (?) batteries. Charging them in the scanner takes 16 hours, and I'd like to be able to do it in 3. I'm planning on buying some new Nicads for my scanner, because these have been recharged thousands of times, and I've dome things that I supposedly shouldn't have, like using the scanner from the mains wih the batteries in, thus charging and discharging the batteries at the same time.

1) What batteries should I buy? Do they have to be 700mAh again, or can I get higher capacity ones? I've seen adverts for those at 1200mAh, but really don't want to risk my precious 8k getting damaged. At the moment I'm planning on getting another 4x700mAh.

2) I've seen a charger that claims to charge 700mAh in 3 hours. Is this safe to use? It's an 8 cell charger/discharger and has a 20mAh trickle. I am unsure what this means. It says that for 700mAh batteries, it'll take 2hrs48mins. There is a cheaper 4 cell charger/discharger/trickle which does the same at uses a 380(???)mAh charge power??? I am unsure.

All I want to know, really, is what batteries to use, and what charger is safe that will only take 3 hours. I live in the UK, so don't recomment popping down to the local radio shack to get their model!

Thanks for your help.

Try the Yupiteru MTV 7100. The European models go from 530 Khz up to
1650 Mhz continuous; 1000 channels, 10 search-bands with pass-out for
unwanted frequencies, attenuator, SSB-mode, etc.

The flight data recorder and cockpit voice recorder assemblies
contain an underwater sonic 'pinger' for sound-location in water.
No radio transmitter.

You may be thinking of a crash locator beacon carried on some general
aviation aircraft. Those transmit when triggered by an accelerometer
or disengagement from the aircraft.

EA>From: ea3aai@intercom.es
EA>Subject: Aircraft procedures

EA>I have an approach chart for runway 07 in the Barcelona airport, with
EA>many frequencies listed as:

EA>TWR: 118.100
EA>APP : 127.70W, 126.50E, 124.70, 119.1
EA>VDF : 119.1
EA>GND : 121.700

EA>I know that 119.1 is the real approach frequency so, what does VDF
EA>mean ?. And, 124.700 is not an approach frequency, since many flights
EA>sign on this freq. but they do not land in Barcelona and make QSY to
EA>another control/route freq. Anyway, many pilots call "Barcelona
EA>approach" in this channel. I thought that "approach" means "landing"
EA>!!.

Approach control frequencies are used to notify air traffic
controllers that an aircraft is en route to landing there...the tower
frequencies are used for the landing clearance itself under ICAO
guidelines/agreements. The tower controller is boss, with approach
and departure controllers assisting; that system helps to cut down on
radio traffic and the airport control-zone local area control.

EA>No doubt with the meaning of TWR/APP/GND, but there are other columns
EA>with headers: GCA, PAR, SRE and SAR which are left blank. What do they
EA>mean ?

GCA is Ground Controlled Approach, the old system of radar landing.
PAR is Precision Approach Radar, now the general method of "blind"
landing assistance via radar that replaced the old GCA.

Not sure, but I think that SAR is Surface Area Radar, a short-pulse,
short-distance radar used for tracking a/c and vehicles on the
airport itself. If so, it would be used by ground controllers.

I owned one for a about a week. It seemed like a good little unit. Cell blocked, but there are ways of hearing image frequencies of cellular if you're interested.

My main gripe with it--and several other Uniden products--is that it does not take conventional AA batteries. It has a nicad pack similar to that found in cordless phones. If you're batteries go dead and you don't have an alternate source of power, you're sunk.

I ended up with a Bearcat 80XLT. It has fewer channels and features but it does take regular batteries. BTW, I believe most of the Radio Shack handhelds take regular batteries also.

258. AR 2700 interference

I'm not sure what type of interference you mean, but on
the particular AR2700 I tested, lots of internally generated
noise was emitted outside the case through the keyboard.
The wideband noise was especially bothersome on the VHF-low
band.

I used a "sniffer" probe to isolate the signals.

For a complete rundown, see October 1995 Monitoring Times.

> 171.845, 171.905.
>As more and more broadcasters use wireless mics, the lower frequencies
are filling up.

A lot of wireless mics are in the UHF range (actually using some of the
UHF TV frequencies that are not in use in the area.)

I work for a television network, and we are in the process of moving up
to UHF mics for in-studio work.

The frequencies you have listed are usually used for amateur and
industrial wireless mics.

If you are interested, e-mail me privately and I will check on what
frequencies we use. This way you could get a rough idea as to where to
look for broadcast mics.

Note that while they may not let you use a scanner or radio device, they will let you use a laptop computer. Also, many aircraft are equipped with air to ground telephones that also put out RF energy.

I think the real reason why they do not want passengers using scanners is that, if they are listening to the communications of their own flight, they are likely to pick up discussions of mechanical problems with the aircraft, or other such things that the airline and flight crew would prefer the passengers not know about while the flight is in progress.

Here is Radio Shack's answer to my question from their website:

PRO-26 Portable 200-Channael Scanner
(200-0506) Hints and Tips Faxback Doc. # 15614

The Hyperscan/Priority button works as follows:

When the Priority button is pushed, you can select a priority channel that will be scanned every two seconds. The Hyperscan feature is turned off. If you push the Priority button again, the Hyperscan feature is enabled, which will allow scanning of up to 50 channels per second. The Priority feature is off. When the scanner is in the Priority mode, the PRI will appear. In the Hyperscan mode the PRI will disappear.

This unit will only hyperscan in the 5 kHz step mode; if the hyperscan button is pressed when the unit is in 12.5 kHz step mode, it will beep to indicate that hyperscan is not possible.

What exactly does a Beartracker (BT-7/10) tune into? Is it only Highway patrol frequencies? Or does it include local police and fire frequencies as well?

I also understand that the Beartrackers also allow some level of programmability. What frequencies do they cover?

Thanks...

On Motorola Trunked Systems, ALL units home to the control
channel of the day, unless thier TALKGROUP is active and
currently assigned to a talk channel, or they are assigned to
a channel for a private call, etc.

There is a logical order in which channels are assigned on a
Moto system. The variables are:

1. Programmed "hang time".

2. Base Station options, e.g. Phone Interconnect, Secure,
etc.

3. how busy the system is.

4. Specific type of system configuration, e.g. PTT/Message
trunking.

The 12ch. system I work on, with 3 interconnect, and 3
encrypted CAPABLE channels runs most (90%) of the time using
only 5 talk channels.

I can answer part of this question. The bc-7 has some programability while the bc-10 does not. The later scanns only preprogrammed police, fire and transporatation etc (hence its popuklarity for highway monitoring)frequencies and that's it. I almost purchased the bc-10 but realized that i could not program some other local freq.'s into the programable bank.

From: Robert Selm <tornado@midusa.net>
Message-ID: <32042871.3113@midusa.net>
Source record: 227718

I have a Pro 37 handheld scanner that I am using in a moble installation. I have the radio hard wired to the car's power with a 9VDC clipper circuit added to make sure that the radio gets either 9VDC or 0VDC. The radio keeps losing it's memory on a intermittant basis. It either completely loses memory or it just loses the memory of the channels that have been locked out. It seems to be the worst when I haven't driven the car for a few days. This is very annoying as I have to reprogram in the freqs every time this happens.

If anyone has any ideas or some direction that they can point me in, please e-mail me.

Thanks in advance,

RFS

Federal Aviation Administration Regulations
14 CFR 91.21 - Portable Electronic Devices

(a) Except as provided in paragraph (b) of this section, no person
may operate, nor may any operator or pilot in command of an aircraft
allow the operation of, any portable electronic device on any of the
following U.S.-registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating
certificate or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.

(b) Paragraph (a) of this section does not apply to -
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the
aircraft has determined will not cause interference with the
navigation or communication system of the aircraft on which it is to
be used.

(c) In the case of an aircraft operated by a holder of an air carrier
operating certificate or an operating certificate, the determination
required by paragraph (b)(5) of this section shall be made by that
operator of the aircraft on which the particular device is to be used.
In the case of other aircraft, the determination may be made by the
pilot in command or other operator of the aircraft.

Delta Air Lines
from the "On Board" section of SKY magazine, January 1995

PORTABLE ELECTRONIC DEVICES - Current regulations prohibit the use
of certain types of portable electronic devices (PEDs) on board
commercial aircraft, due to the potential for interference with

navigation and communications equipment.
The following devices may not be operated at any time on Delta aircraft: cellular telephones, commercial two-way transmitters (i.e. walkie-talkies); amateur transmitters (i.e. ham radios); citizen band (CB) transmitters; 49 MHz transmitters; devices designed to radiate RF energy on a specific frequency; peripheral devices for computers or games connected by cable (i.e. printers); AM/FM radios and portable TV sets; remote-control toys.
The following may not be operated when the aircraft is at the gate, in the taxi, take-off, initial climb, approach, and landing phases: personal computers (cable-connected peripheral devices such as printers, external disc drives, etc, are not authorized); personal computer games; VHF scanner receivers; compact-disc players; digital/ cassette-tape player-recorders; video recorders/playback systems; calculators.
The following may be operated at all times: hearing aids; heart pacemakers and other implanted medical devices; electronic watches; electronic nerve stimulators; properly certified operator-installed and -maintained equipment, such as the public passenger-telephone equipment. Personal life-support systems may be operated during all phases of flight, provided that the equipment conforms to the criteria established by the administrator of the Federal Aviation Administration (FAA).

United Airlines
press release

UNITED AIRLINES PROHIBITS USE OF
PORTABLE ELECTRONIC DEVICES DURING TAKEOFFS AND LANDINGS

Chicago, June 22, 1993 -- United Airlines today announced that effective July 1, it will prohibit the use of portable electronic devices, such as laptop computers and compact disc players, onboard its aircraft during takeoffs and landings.
United said its policy was developed to address the possibility of such devices causing electromagnetic interference with cockpit navigation or communications systems when aircraft are on the ground or flying below 10,000 feet -- the most critical phase of aircraft operation.
"We have not experienced any safety problems with these devices, but enough questions have been raised in the industry to prompt us to implement this policy as a precautionary measure until further study determines if any safety hazard exists," said Ed Soliday, United's director-corporate safety and security.
Excluded from the new policy are electronic medical devices -- such as hearing aids and pacemakers -- and electronic watches, which may be used onboard an aircraft at any time.
United said when an aircraft is flying at or above 10,000 feet -- which normally occurs within 10 minutes of takeoff and until 10

minutes before landing -- passengers may use the following devices:
o compact disc players;
o electronic cameras (film or video);
o electric shavers;
o hand-held electronic calculators;
o hand-held electronic games;
o portable audio tape players;
o portable video players (tape playback only);
o portable voice recorders (dictation equipment);
o portable computers with accessory printers and tape
or disk drives.

-UA-

American Airlines
from the "Vantage Point" column of American Way magazine, July 1993

[....]

Products known to cause problems include cellular phones, portable radios and televisions, and remote-control toys, which federal regulators have long barred on commercial aircraft. (The Airfones available on most of our airplanes are specially engineered to eliminate interference with aircraft systems, and they have been thoroughly tested to ensure that result.)
The jury is out on whether other devices - small computers, compact-disc players, hand-held video games among them - have similar effects. Although scientific studies have been inconclusive, there is mounting anecdotal evidence of sporatic and poorly understood problems. When safety is at stake, taking avoidable risk is simply unacceptable. That is why some air carriers outlaw the use of electronic devices during all or part of their flights. American Airlines announced recently that it will no longer permit the use of such devices during takeoff and landing, and while flying at altitudes lower than 10,000 feet, the phases of flight during which cockpit instruments are used most intensively.

[....]

Atlantic Southeast Airlines
from the ASA Flight Attendant Manual, pp 3-49&50, November 2, 1993

3.13. Portable electronic devices

A. Regulations

The FAA prohibits use of electronic devices such as AM/FM radios, cellular telephones, etc. during flight. These receivers have circuits which can radiate signals strong enough to interfere with the aircraft's navigational systems. Non-transmitting portable electronic

devices shall not be used during takeoff and landing when the seat belt sign is on, or when directed by a crew member, or during operations below 10,000 feet. However, non-transmitting portable electronic devices may be used at other times. If interference from the portable electronic device is suspected, the captain may prohibit operation of the device.

1. Prohibited equipment
The following may not be operated at any time on ASA aircraft:
a. Cellular telephones.
b. Commercial two-way radios (i.e. Walkie Talkie).
c. Personal two-way radios (i.e. Ham operators).
d. Citizen Band (CB) radio.
e. 49 MHz Transmitters.
f. Peripheral devices for computers or computer games (i.e. printers, external mouse, "joy sticks").
g. AM/FM radios and televisions.
h. Remote controlled toys.
i. Devices designed to radiate radio frequencies (RF) energy on specific frequencies.
j. Cassette tape players with AM/FM radio capability.
k. Cpmpact Disc players.

2. Acceptable equipment
The following may be operated when there is not a sterile cockpit in effect. The devices must be turned off when the seat belt sign is turned on for approach.
a. Personal computers (see restriction f above).
b. Personal computer games (see restriction f above).
c. VHF scanner receivers.
d. Digital cassette tape player-recorders.
e. Video recorders/internal playback systems.
f. Calculators.

3. The following devices may be operated at all times.
a. Hearing aids.
b. Heart pacemakers or other implanted medical devices.
c. Electronic watches.
d. Electronic nerve stimulators.
e. Electric shavers.
f. ASA installed equipment.
g. Pagers.
h. Acceptable personal life support systems.

Southwest Airlines
(from correspondence dated 12 April 95)

Ground Operations Customer Service Manual -

The FAA allows inflight use of headsets, portable computers, calculators, and electronics games, provided they can be stowed properly in accordance with this rule. Customers should be requested not to use these devices during takeoffs and landings. The FAA does not allow inflight use of walkie-talkies, radio controlled toys, AM/FM radios, portable telephones, or portable television sets, all of which may affect aircraft radio and navigation equipment.

Safety Cards -

Portable Electronic Devices Not Acceptable
Telephones
Radios, AM/FM, VHF, battery or cord operated
TV sets -- battery or cord operated
Electronic games or toys with remote controls
Computer, calculators, or typewriters larger than a briefcase and cannot be stored under the seat
Data entry pad, hand held with umbilical cord attached

287. portable scanner antenna lengths

I just ordered a Grove 7"-46" whip antenna for my BC3000XLT. I'm using a formula for antenna length as follows:
234 ft/freq in MHz times 12(for inches)
ie. for best antenna length for 155.000 MHz reception:
234/155.0 x12 = 18.1 inches

I don't remember where I got the above formula. Could anybody confirm if the above is correct, and if it will work through all the 25-1300 MHz ranges? Thanks.

Hi all,

Jack had a legitimate gripe and this is my public explanation and apology. I work at sea on a merchant ship and got called out on short notice. I told myself that Jack needed to be paid before I left, but in the hectic race to get packed and out to LA to join the ship, I flat overlooked sending the check to Jack, which was made out and sitting here by the computer. I am rightly embarassed and ashamed that my good name has been tarnished but this was simply an honest mistake. There are many people who frequent this newsgroup who know that I'm an honest person. I've sent Jack the money and personally apologized to him for the oversight. Since I work for about 3 months at a time at sea, I had no way to access the internet and defend myself.

Again, I publicly apologize to Jack and this newsgroup.

Thanks and 73,

Jon Van Allen KF7YN

EM>Do scanners emit much or anything in the microwave region? With cellular
EM>phones there was that controversy over whether antenna emissions caused
EM>any harm. Even the manual to my cellphone mentioned not to touch the
EM>antenna while the phone was transmitting, and not to hold it such that
EM>the antenna was within three feet of another person (of course its much
EM>closer than that to the user's head...)

EM>Is there a problem with carrying a scanner on your belt, or coming into
EM>contact with the scanner? Of course any emissions are doubtlessly less
EM>than the 0.6w to 3w of a cell phone, but then you don't generally
EM>transmit for hours at a time on a cell, while that amount of time
EM>wouldn't cause you to pause twice with a scanner.

Scanners will leak a little RF, but the value is very very very small. The
local oscillator puts out a pure high freq RF carrier. Then there are
the intermediate freqs.

Why not live dangerously and take up ham radio. We are talking serious
RF energy now.

I'll have to echo that sentiment as well, in Jon's defense.

I've conducted numerous deals with him, and he has always been totally
honest and above board.

This is not to say that you do not have a legitimate beef.

He is currently at sea, and I forwarded your post to him. I'm sure
he'll be thrilled to see it upon his return. I'm sure he will address
your concern.

298. F.S. - Universal M-400 Decoder with computer interface for pager decoding

Newsgroup: rec.radio.scanner
Date: 1996-08-03 00:00:00 UTC
From: johnsw@mhv.net
Message-ID: <3202b5e3.2683666@news.mhv.net>
Source record: 227765
Cross-posted to: rec.radio.scanner,rec.radio.swap,alt.radio.scanner,rec.ham-radio.swap

I have a Universal M-400 multi mode decoder for sale complete with CI-400 computer interface for monitoring / logging of pager data to screen and/or disk and /or printer. The unit is the latest software version - Version 2.0 and will decode the following:

Shortwave capabilities: VHF-UHF Capabilities:

Baudot ACRS
ASCII POSAG pager data
Sitor A&B GOLAY pager data
FEC-A CTCSS (PL) Decoding
SWEDE-ARQ DCS (PL) Decoding
Fax (To Printer) DTMF Decoding

The CI-400 interface interfaces the M-400 with your pc via an interface card for your pc and its associated software. Once these are installed, all the paging data is fed to your pc's display and you can set your pc to alarm when your preprogrammed cap code(s) are detected and the message will be highlighted, and/or saved to disk/printer for later viewing. Works real well ..... If you not sure what the unit's about check Groves home page for a complete description or e-mail me for any questions ..... Unit is in excellent condition and comes complete with manuals, software, interface, cables and a/c adapter. $325 for all

Well said Mr. Cheek.

The demeanor of the internet community has certainly taken a turn for the worse in the past couple of years. This is due in large part I believe in simple lack of knowledge. Many people these days feel they are invulnerable, that they can hide behind a false persona and cause havok and mischief at will. Nothing could be further from the truth. I know, six years ago I spent 14 months on house arrest for computer related crimes. It was during this time that I discovered scanning, and found a healthy outlet for my voyeuristic cravings.

I really don't give a rat's ass about the subtle politics involved in this newsgroup. All I want is answers and information, and Mr. Cheek has readily supplied both. Thanks Mr. Cheek.

To the Upset Bell guy

Imagine if you will the fact that all well-accessed traffic-laden
groups in the system have the same "pleas" for some sanity
in this group.

It's a fact of group-think on the net.....

Just don't read them and you won't get upset.
It's obvious by the Subject what the poster has on their
mind.

What you resist, persists. Let it go. Don't let the
ingrates control your emotions. Don't let the bait be
allowed to control you. Just swim on by. Take another
bus. Buy another ticket.

If everyone did this, then those who do do what they do,
would not get any stroking from upsetting you....putting
you into an ANGST-attack.

Don't push the river....it flows by itself.

Hi Dave, I've tried the TV antenna approach and it only works to a point. I've used a RAdio Shack discone for 5 years, it works fine for general coverage but is way to intermod prone as all discones are.

The Diamond discone is about equal to the RS for my listening preference but some feel it's a bit better. It does cost twice as much as the RS.

If you can build one, try one of the ARRL books. The Handbook or one written just for antennas will guide you. I built one of the handbook gain antennas several years ago and it out performs all the discones I've tried since it isn't as intermod prone.

I built mine for UHF reception but it equals the discones on the VHF band and on certain freq's it's better.

Another antenna for builders is one that Clem Small published in March '96 U. S. Scanner News issue. They might have back issues available.

I built that particular one for VHF gain and it runs away and hides from the discones - and no intermod to speak of. I think Clem's design may be a wider band antenna, which I prefer but it has good gain and is very easy to build, super antenna, and it's cheap to build. Material can be had at a hardware center like Home Depot.

Cushcraft has quite a few Ham antennas but I believe they will build one to your specifications (one of the manufactures does). This will be they best way to get gain, reduce intermod, and have an all around good antenna.

A ad in a Ham mag a few years back had one fellow offering software to design your own antenna, if I can find his address in my notes I'll forward it to you.

Regards,
LGS

Just what Fido rule did he break? All the man said was that appeared
that lot's of us here are fed up with you. And that you were being
kicked rather hard here. As a former FIdo sysop, I don't recall any
sort of rule that was violated by his message. There was no flaming,
name calling etc. Just his assesment of what was going on here.

Your over reaction to his message just seems to lend credence to what
has been said about your dictatorial rule in Fido land. What don't
you just go back there and enjoy your little empire?

BTW how the hell do you find the time to continue this drivel? Don't
you have to do something to earn a living?

311. Trunked systems questions

Newsgroup: rec.radio.scanner

I'm fairly new to scanning, and have questions regarding the 800 MHZ trunked frequencies. I started monitoring them using a Radio Shack PRO-24 handheld, but it way too few channels for the area I was in, and the delay gave me problems keeping up, so I switched to a PRO-51. BIG improvement for only $70 more. =)

At any rate, my main question is, is there any rhyme or reason to how frequencies are assigned or switched? Also, any tips on how to keep up with the changes?

Thanks in advance...

312. Re: Ignition Noise on scanner

Ha ha ha ha. Ferd, huh? Well, I had a '65 Chevy Malibu SS that would put a Ferd out to lunch in the noise emissions department. That sucker plugged every receiver for miles around every time I fired it up. Sucker was faster 'n greased lightning, though.

Bill

313. NiCd Cell & Recharger Basics

-Bill Cheek-

I decided to write an article on proper care and feeding of NiCd cells, so following is some enhanced material in addition to what I already gave you under the subject line, Pro43 Charger Voltage. Some of this is redundant so bear with me. Some has been rewritten for clarity or error correction. Some stuff is new. Fire questions on anything you don't understand. Suggest corrections for errors or clarifications of ambiguities, as you see fit.

First, the givens. NiCd and NiMH cells need to be promptly recharged to full after each use. Full recharge is a misunderstood parameter, but has an absolute maximum of 1.44 volts per cell. Much less than that, and the cell is jeopardized by under-charge, so let 1.40 volts per cell be the minimum acceptable full charge. (This will vary with the age and condition of the cell, however.) Older cells may reach a maximum of 1.3 to 1.35v per cell. They're probably goners if they can't be recharged above 1.3v per cell.

Forget the old wives tale about "memory effect". Over ten years ago, a study performed by General Electric and Gates for NASA was reported in the NASA Technical Journal. The extensive study by prominent manufacturers of NiCd cells failed to turn up any evidence of the alleged "memory effect". The urban legend persists to this day, but there is nothing to it.

Also a given is the point where NiCd and NiMH cells are considered fully discharged: 1.0v per cell! Now if you think about it, this is why most cells are imprinted with a "nominal" value of 1.2 or 1.25v:

1.0v + ((1.44v - 1.0v) / 2) = 1.22v (half charge!)

Next given is the milli-ampere/hour rating of a cell. Typical values for the common "AA" cell are: 600-mA/h, 800-mA/h, and 1000-mA/h. NiMH cells usually have the highest value while "heavy duty" NiCds have the middle value, and regular NiCds have the lowest value, but it really depends.

Usually, the mA/h rating of a cell is printed on it somewhere. If not, then you better assume 600-mA/h unless you know different. The mA/h rating of a cell is generally regarded to imply that the cell can produce THAT amount of current for one hour before reaching the 1.0v full discharge point.

To discharge a cell below 1.0v is to risk permanent damage to the cell.

Then, we have the recommended recharge rates for NiCd and NiMH cells. There are usually two rates specified; the first, a maximum "fast charge" rate, generally stated to be "C/3" and the other, an indefinitely SAFE "C/10" rate.

The "C" is regarded to be equal to the mA/h rating of the cell, so C/3 is mA/h divided by 3 while C/10 is mA/h divided by 10. As an example, a "AA" NiCd cell rated at 600-mA/h can be fast charged at 200-mA in about 4-6 hours without damage to the cell, but if charged at that rate any longer, the cell could be permanently damaged.

The same cell can be charged at the C/10 rate indefinitely without risk of damage, but of course, the time to reach a full charge can be 14 hours or more. After reaching full charge at the C/10 rate, the cell (or pack) can be left "floating" or "trickle" charging at this same rate indefinitely.

Other tidbits you should know include the following:

1. The mA/h rating of two or more cells connected in series is equal to the mA/h rating of a single cell.

2. Series connections of cells retains the current capacity of a single cell, but the output voltage of the pack is equal to the number of cells multiplied by the voltage per cell.

3. The mA/h rating of two or more cells of the same type connected in parallel is equal to the mA/h rating of one cell multiplied by the number of cells.

4. Parallel connections of cells retain the terminal voltage of a single cell, but the current capacity of the pack is equal to the number of cells multiplied by the mA/h rating of one cell.

5. Battery packs for handheld scanners are almost always four or six cells connected in series. Cordless and cellular telephones vary, but three series cells is common.

6. Parallel connection of NiCd and NiMH cells can be done, but is generally regarded as unsafe or risky to longevity of the cells. This is because if one cell of a parallel pack fails, it can cause the other cells to fail in rapid succession. If one cell of a series-connected pack fails, it is more likely to have a conservative effect on the remaining cells.

7. You can make a fairly reliable test of your NiCd/NiMH and
recharger system as follows:

A. Leave the pack on recharge for a time sufficient to assume
that it is as charged as it ever will be, say 18-24 hours.

B. Remove the pack from the recharger and immediately measure
the voltage at its terminals. The maximum that should be
measured is 1.44v per cell (multiplied by the no. of cells)
If the cells are relatively new, the minimum that should be
measured is 1.40v per cell (multiplied by the no. of cells)

C. Leave the pack off the recharger, and measure its terminal
voltage periodically to see how rapid is the "settling" and
self-discharge rate. After a variable settling rate, and the
the self-discharge rate of NiCd cells is about 1% per day.

If your cells test at greater than 1.44v per cell in 7.B., your
recharger is much too stout for the cells and will probably damage
them or shorten their useful service life. If your cells test at
under 1.30v per cell, either the recharger is deficient, or the
cells are old-aged or damaged. The recharger should be checked as

described further below. If possible, you should repeat the test
with a brand new or known good set of cells.

If your cells test at between 1.30v and 1.35v per cell per 7.B,
this is grounds for suspicion, but not alarm. If the test comes
in at between 1.35-1.40v per cell, you can probably relax unless
you're a "purist". At 1.40-1.44v per cell, you're in Nirvana.

I don't really have a feel or guideline for the settling rate
after fully charged cells are removed from the charger, but old
or defective cells will settle much more rapidly than new or
prime cells. "Settling" can be described as the decay in terminal
voltage over the space of 30-mins after the fully charged pack has
been removed from the recharger. All NiCd/NiMH cells will
"settle" by at least a few hundredths of a volt shortly after
removal from the recharger.

Now it's time for meat 'n taters. The remainder of this article is
a take-off from and an enhancement an earlier article I wrote under
the subject Pro43 Charger Voltage. Some new material has been added
to the end to make it easier to test, design or replace your recharger
as needed.

DISCUSSION
==========

Example used is the PRO-43 handheld scanner. Details may differ from
one scanner to the next, especially the value of the internal limiter
resistor, Rs.

Subject: Pro43 Charger Voltage

> What is the maximum open circuit voltage for a charger for the PRO-43?

Factory stock? Well, you want to apply 1.44v (max) to each NiCd cell,
times 6 cells, for a total of 8.64v, absolute max. The minimum, to
assure full charge is 1.40v per cell, for 8.40v, minimum full charge.
Anywhere between is ok. But that ain't the end of it.

There is a series diode in the recharge circuit in the scanner that
drops 0.6v no matter what, so add that in. Then there is a series
resistor of 22-ohms and two chokes of about 0.5-ohm each. So
resistive drops have to be added in, too. The sum of all the voltages
is what the maximum *loaded* terminal voltage of the recharger should
be, so let's calculate:

Pack must not exceed (max): 8.64v (6 cells x 1.44v), or
Pack needs to be at least (min): 8.40v (6 cells x 1.40v)

Diode drop: (estimated) 0.60v (Measure it, if you can!)

Resistive drops:
Using the C/10 trickle rate: mA/h rating of pack divided by 10.
Will assume 600-mA/h cells, therefore a C/10 of 60-mA:

Rs is 22 ohms and 1-ohm of choke resistance makes 23 ohms.

E = I*R
ERs = (Ic10)(Rs)
= (0.060a)(22+.5 +.5)
= .06 x 23
= 1.38v
==========
Recharger Supply (Ecmin) 10.38v min (DC) (at 60-mA drain)
Recharger Supply (Ecmax) 10.62v max (DC) (at 60-mA drain)

When there is no current drain (open circuit), the terminal voltage
will be max, but it cannot be predicted, since the internal resistance
of rechargers varies from one to the next.

It is best to connect a variable resistor to the recharger terminals
with an ammeter in series; adjust for 60-mA (or the C/10 rating) and
then measure the terminal voltage to ensure it does not exceed the
calculated limit. Then remove the resistor and see what it rises to.
But that would be the open circuit limit ONLY for that recharger.
Other rechargers would differ. So that parameter is not so good.

> charge...??? I've read that there's a 20 ohm resistor in the charge

> circuit of the 43 to limit current...and I was wondering if there's a
> max open circuit voltage so that the resistor won't be fried???
> Reason I ask is that a couple of my 9V packs have open circuit
> voltage at 14+ volts.....(thought that was a little too much!)

Well, you got the right idea, all right. But the Eoc (Open Circuit Voltage) of the recharger is not your target so much as the loaded output when it is producing 60-mA or whatever the C/10 rating of your pack is. If it's a 1000-mA/h pack, then C/10 is 100-mA or 0.1-a.

Soooo, break the (+) wire from the recharger, and insert a milliammeter between the breaks. Connect a 250-1000 ohm potentiometer to the terminals at the end of the wire. Adjust the pot so you're drawing C/10 of current, and then measure the terminal voltage. If over the calculated limit, it will over charge the pack. Limits are best determined as 1.44v per cell, fully charged, max. And 1.40v per cell, fully charged, min. Anywhere between is perfectly ok.

If you only have one meter, then remove the milliammeter, close the breaks in the wire, and set the meter to voltage to measure the recharger while it is still feeding the pot with C/10, see?

Of course, you have to repeat the calc's above if your C/10 differs from 60-mA. But it will lead you to a MAX trickle charge voltage of the recharger at its terminals.

It's the CALCULATED limit that requires your attention; not the open circuit voltage! If a recharger has a significant internal resistance, then its open circuit voltage is meaningless.

This is to say that one wall adapter with 14v Eoc might be safer than another one with 12v Eoc. Soooooo, using the above information, you can CALCULATE additional dropping resistance (Rd) to insert in the "breaks" of the recharger wire where we put the ammeter.....IF otherwise, the calculated limits are exceeded by the recharger.

Example: If the calculated limit above is 10.6v, but the recharger puts out 12v @ C/10 of 60-mA, then let's figure the additional series dropping resistor, Rd, needed:

Needed: to drop 12v to 10.6v = 1.40v drop
Calc: Rd = E/I
= 1.4 / .06
= 23 ohms.

A 22-ohm resistor is common and would work fine for THAT recharger ONLY.

STEP BY STEP PROCEDURE TO ASSURE PROPER CARE
AND FEEDING OF NICD AND NIMH CELLS
==========

Recharger powered up but NOT connected to scanner!

0. Determine the optimum trickle charge
rating (C/10) of your battery pack:

C/10 = (mA/h rating of one cell) / 10
= _____ mA/h / 10

*** C/10 = _____ mA ***

NOTE: mA/h rating is usually printed on the cell. If not
then assume 600-mA/h unless you know different.

1. Cut (+) wire in recharger cord at Point "x".
2. Insert milliammeter at points "x"
3. Connect a 250-1000 ohm trimpot at A and B
4. Adjust trimpot for a current drain equal to
C/10 (Line 0) of the NiCd pack.
5. Measure Voltage at Points A and B: _____ volts (Ec10)

6. Maximum Pack full charge is:
____ No of cells x 1.44v = _______ volts (Emax)
in pack
7. Minimum Pack full charge is:
____ No of cells x 1.40v = _______ volts (Emin)
in pack
8. Diode drop: 0.6v, or measured = _____ volts (Ed)
(Best to measure the diode drop, but
assumption of 0.6v is ok)

9. Resistor (Rs) voltage drop at C/10 current: (ERs)

Determine Rs in your scanner: = _____ ohms, limit resistor
Choke resistance, 1/2 ohm ea = _____ ohms, chokes, total

Add Rs and Rchokes = _____ ohms, total Rs

(For the PRO-43 example, consider 1/2 ohm per choke
(as a part of Rs, for 22 ohms plus 1 ohm = 23)

ERs = I*Rs so:

ERs = (C/10)(Rs) = _____ volts (ERs)

10. Ideal C/10 Recharger output volts:
Add Lines 7, 8, and 9: = _____ volts (ECopt)

11. Is Line 5 less than Line 10? If yes, go to Line 12, else
Is Line 5 greater than Line 10? If yes, go to Line 13

12. Sorry, this recharger will not fully recharge your
NiCd cells and may be harmful to them in the long run.
NOTE: If Line 5 is within 0.1v of Line 10, then it's
probably ok, and you need do nothing more.

13. The recharger is too stiff for this NiCd pack. You
have three choices:

A. Break into the scanner and replace Rs (above) with
a higher value, calculated in 13.D below, or

B. Buy the proper recharger for that NiCd pack, or

C. Calculate a value of an external dropping
resistor, Rd (above) and insert at Points "x".

1) Line 5 - Line 10 = ______Volts (Ed)
2) Rd = Ed/(C/10) = ______ Ohms (Rd)

D. New value of Rs, if you want to replace the
internal resistor in the scanner instead of using
an external resistor, Rd:

Rs(New) = Rs(old) + Rd

Rs(New) = _______ Ohms

I have it on fairly good authority that USSN hasn't paid its writers
in four months; hardly a "year", but still somber enough.

The entire radio market is suffering and there is no real relief in
sight other than the traditional Fall "perk up" as the weather turns
and more people come indoors to play.... but this appears to be be the
worst summer on record, and last winter was one of the worst.

So the prognosis is not good.

How can that be? At least for the time and expense?

>On the other hand, a tv anteanna on its side may work, but I do not
>think it will do very well.

TV antennas are designed for:

54-88 MHz
88-108 MHz
174-216 MHz
470-890 MHz

With subresonances and overlap, WHY wouldn't a TV antenna work
superbly for scanners (assuming it is installed in the vertical
plane)?

Gain and F/B ratio of directional TV antennas are GREAT. And the
suckers are cheap, since most everybody already has one or more.

A wideband log-periodic -=might=- be competitive with a TV antenna,
but even then, it's not cut and dried. Multi-element yagis are great,
but not for scanners because they're good for one or two narrow bands.
Not the entire spectrum.

In any event, I've used TV directionals for all-purpose VHF-UHF
antennas for YEARS and they perform very, very well......indeed!

Rgds,

Bill

Well, I had to send this in reply to an E-mail I recieved reference one of my "reply's" in this newsgroup, so I guess I'll cut and paste it here too.

George,

Please spare us the pleasentries. The last time I looked, a newsgroup was a place to share ideas, opinions, and thoughts.
If you have a conflict with such, newsgroups probably aren't the place for you. The internet is a vast expansion of personalities, Myself and you are amongst millions. Please take the time to sit down, and not try and save the internet world.

Also, in the eyes of many internet users, AOL and their "Terms of Service" is quite the insult and "laughing stock" of the internet community.
Please, try not to make a habit of pushing your petty "TOS" and rules off onto the rest of us. Scanning is a hobby and a recreation in which all users in this group share. Please don't make a mochary of it by doing such.

Tks,
~5150~

It's called: RAC.... random accessed confusion

The agency is assigned a given number of freq's....say
16. Those freq's are that agencies use....programmed into
a 800 trunk radio sysem....the mainframe computer takes
over and don't care much for any such thing as "ORDER"....

There are sixteen choices which are possible and the computer
deals with all sixteen as one....so sixteen are possible at
any given click of the mic....whatever channel is used has
16 possible inputs to find and broadcast.

That is why it's so hard to monitor when the system is busy.
On those channels you can have police patrol
dispatchers,fire,ems,dog catcher,juvenile div., divers, S&R
dist attrny, vice, sud units, traffic, etc. Just from one
city agency. Plus you can also have traffic from another city
or two ... usually when the channels get up near 30...they
have access which is not used and they sell time to other
cities to offset cost of.

What you have is a clearing house....all these cities and
depts. with chatter over any possible NOT IN USE channel
found by the computer each time the mic is keyed. That
starts the process. It's like sixteen radios working
simultaneously with the computer in charge of distribution
24 hours a day.

You want to listen to police dept and with that you get to listen to all dept's who get in your way on your trip on the system waiting for the police to come by again....

some use two radios....program half on one /half on other or the 858's on one and the 868's on the other and chance becomes halfed...some go out and buy a radio from the agency that allows it and pays up to 2500 for the privilege. prices are coming down to around 1000...two systems: ERickson/GE and Motorolla.

Each system is different by can be listened to by scanner. Upcoming is digital radio systems....no scanner will be able to listen....unless some genius figures it out and has major bucks to break it.

There are rumors that some people have cracked how to get access to trunked via their programming skills. Hear a lot, but those who claim it never come across with the product.....just promises

bill

Why? What happens if they aren't?

Lead-acid cells are damaged by storage in a discharged state.
I've seen no convincing electrochemical explanation for such an assertion
about NiCd cells.

>To discharge a cell below 1.0v is to risk permanent damage to the
>cell.

Why? What happens if you do?

The more common useage of this statement I've seen is that it is unsafe to
discharge a series-wired nicad PACK to a total voltage which would imply
less than 0.95 - 1.0 volts per cell. At that point, a nicad cell is about
95% discharged, and voltage falls rapidly - so much so that you risk
sending it into reverse charge as the rest of the series pack feeds
current through it.

But what damage is done by discharging a naked cell to zero?
Explain, please ... be technical.

Welcome to the great world of scanning.

In your questions about trunked systems you asked about the way
channels are switched in trunked systems. I do not know much
about turnked system but what I do know is the following:

It depends on what type of turnking system. Some systems a fleet
would be assigned a 'home channel" many different fleets may in
fact have this same home channel. What this means is that if you
want to monitor ABC Tow-truck then you would often hear them on
one channel. If it were in use by another company then it would
switch to a second channel, third channel etc until it find the one
not in use. The main thing here is that on this type of trunking
system you will often hear the same company on the same channel until
it becomes busy.

On the Motorola Systems. I've seen up to 25 channels in the system.
It is very difficult to monitor becasue many more users share the
25 channels and and pop up on any unused channel that the system will
asign them. There does not seem to be a 'home channel'

If you are near by the person talking and you want to hear them try
and plug into your scanner the trunked radio frequencies minus 45Mhz.
(for the 800mhz band users) What you will find is the actual
signal from the radio near by. This is what is sent to the towers
and retransmitted back plus 45 Mhz higher in frequency.

This may often work well when in close range. Same applies to
cellular phones. Why? Well the signal is weeker and does not
travel as far. What you here is within a limited range and the
chances of someone else using a trunked radio co close to the one
your trying to hear is much less then hearing eveything over the
tower frequencies.

No matter what you do, unless you have a trunked radio programmed
to the ones you want to monitor, its very difficult to follow.

Good Luck

It is possible that you are hearing an 'image'.

Radios produce signals in a mixing process that may end up sounding like a dead carrier in an unwanted place such as your 146.005

Some Scanners are worse then others becasue of poor design these internaly generated signals mix with others and pop up all over the place.

What you will most likly notice if this is the case is that the signal strangth is the same everywhere you go. Because its comming from your radio.

Then again their could be something like a computer near buy or even a cars computer that may generate this signal.

I think this is what you are hearing.

Oh well, it looks like the claims that this charger makes are
incorrect then. Looks like it's back to the drawing board :-/

> That means if you drain those cells at 233-mA for three hours, and then

I can get a charger that takes 4h15mins also, if that would be safer.
It's a lot cheaper as well :-)

> Why don't you first perform the simple test(s) listed in the middle area
> of the document I posted......the measurements of terminal voltage at
> full charge and then the settling period measurements. That will tell us
> a lot.

I can't. I've not got any test equipment, because I'm not really into
electronics etc. All I know is the very basic stuff, like polarity
and how to operate all the 8k's features ;-)

> So long as you choose the same physical size and general type of

> purpose of my article, you see.

I'm probably going to get some more 700mA batteries, because the ones
I have at the moment are safe, even if the case of the AR8000 does
heat quite a bit. I know this isn't to do with the batteris though,
more because of the way the 8k is designed.

> If you can acquire a schematic of the AR8000 and send me a copy, I'll be

Unfort, I can't get hold of this, but I'm tempted by the 1200mA cells.

> Well, the maximum SAFE recharge rate for 700-mA/h cells is 233-mA, the

Almost, it's 380mAh, so it would be more like C/1.84211 :-)

> Ha ha ha ha. Well, so long as you are willing to take the risk on

Maybe I'll get both a decide which work best.

> So long as you have a properly designed recharger, I'd be inclined to go

> clear, but for a modest cost, I'm sure you can handpick some cells that
> will withstand the higher recharge rates.

I'll get both I think, and one of these chargers which automagically
detects how much power a battery needs and turns itself off when
finished, therefore I won't have to bother knowing about when I should
have to turn it off ;-) It shows the voltage (current??), no voltage,
in the cells at all times, so I could see it rise up to the 1.2 it
says it is. And it automatically discharges them. Hmmm.

Thanks.

BC>Not to worry, though, I think scanning holds some potential and
BC>excitement through the end of the century. But long term outlooks
BC>are not exactly orgasmic.......

Not to mention the rise of trunking systems in several major metropolitan areas, and the slow, make that non, response by the major scanner manufacturers, both of them, to the newer technologies. Uniden is still the only manufacturer to offer a scanner with CTCSS. Lots of consumers want/need scanners with this feature, but response has been slow. Of course, this is not exactly new technology either. Not to mention DCTCSS, trunking, digital modulation, and other technologies. If scanning dies, it will not be because there are no interested buffs, but because the companies that make the stuff didn't respond to changing technologies.

332. FCC Ruling Will Require Some Hams to File Environmental Impact Reports

Newsgroup: rec.radio.scanner
Date: 1996-08-04 00:00:00 UTC
From: vbook@vbook.com
Message-ID: <4u2uvk$8bd@news.accessone.com>
Source record: 227549
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.scanner,rec.radio.shortwave

The FCC has issued new rules regarding the evaluation of RF Emissions and
health effects from all transmitters. As always, the devil is in the details
and the details say that if you transmit over 50 watts, you may have
to perform an RF emissions environmental assessment of your Amateur station.
Under the new rules, the FCC will add five more questions on RF safety to three
of the written exams. Amateur radio operators will be required to certify as
part of their license application, under an as yet unspecified mechanism, that
they understand the FCC rules on this issue. In some situations, certain
Amateurs may have to file a complex "Environmental Assessment" better known as
an Environmental Impact Report regarding their Amateur station operation.

You can read the complete text of the relevent FCC ruling in FCC 96-396 at
Ham Radio Online magazine, available on the Internet at:

Source record: 227550

I just picked up a BC 20/20 at a thrift store. I figured out that it's pretty much like my older BC 211, but a couple things are different.

Like:

What's that "Position A/B" slide switch on the front for?

How does the scanner know whether to use the AM or FM detector? Is it based on just the frequency range that's programmed?

The RF board inside the 211 looks just like the 20/20 RF board except that the 20/20 has the AM detector section. Does that mean that the frequency band coverage in the two are the same? With the addition of the aircraft AM stuff, that is.

I paid $169 (recent sale price) frm RS new about 2 weeks ago. Mine has a
date code of 4A4 also. I haven't found out if there are any mods for this.
Although, people are saying it similar to the BC890XLT, which may be
modifiable for cellular (I have had a chance to try the mod yet). If I was
buying this scanner used, the new sale price is $169 at RS, and it's in
descent shape, start with $30 off. Consider if it has the CTCSS board
installed already (they cost $39.95 extra).

Small, battery operated DTMF decoders. Has pigtails for audio
connection to your scanner/phone line, tape recorder, etc. Both have
non-volatile memory (511 or 512 digit storage), and RS232 output. One
has a 16x2 line LCD display. See web page for details.

Three months old, mint condition, programmed and with one out of band mod.
Date code of "10A5"

A/C adapter, box and manual included.

Can get cell "images", but not direct entry :(

Bought new for $319, would take $200 as that seems to be the on sale price.

Please reply via e-mail.

Shipped anywhere.

Hello Clay, As you may know, I have had an Ontario
Web Page for Scanning frequencies for sometime now. In a public
post on REC.RADIO.SCANNER I noticed a link mentioned about
your page. It has been some time since I checked your page
out.

What I found today in the Ontario section seems to be outdated.

You also have copies of information from past web pages and
posts of mine directly in your pages. I do not agree with
this for a few reasons.

First, A lot of work goes into making sure that my information
is correct and up to date. You seem to have older material
of mine some even from FEB 95. While you do give me credit in
some places, this is to old and incorrect info. In many places
there is no credit at all.

I have no problem with you linking to my pages or using some of
this public information, I do when it is a direct copy of past
work of mine. I don't think I have to explain why.

May I suggest you take some time to look at your Ontario pages and
have a look at what I am talking about. I think you will be able
to find it easily. Also most of the information is repeated with
credit to others. I don't understand this.

Please don't misunderstand me. I do not want to discourage you
from having an Ontario section. Its a hobby and we are helping
others out. But we both know how much time it takes to update
and correct our material. You may find it easier to link to me
instead. At least we could provide accurate information
this way, when my job involves scanning in Ontario and I can keep
track of these changes almost daily.

Does anyone have the Shakopee, MN police "channel two".

The context is "2345 copy CHANNEL TWO for name and number"

None of the databases had it.

Please e-mail me direct with the info.

Thanks

Jay Lyle

: It is my understanding that the Pro-2036 is essentially the same scanner as the
: Uniden BC890-XLT. That being the case, here is the mod sheet I have for the
: 890. Proceed with caution as I cannot confirm this information. Hope this
: helps.

: Glenn Reed, KF5XB
: CAP - OKWG/DCA

: ==

: BC890XLT

: Subject: bc890xlt-800mhz full restore

: 1. remove all cabinet screws.
: 2. remove 4 face plate screws and 1 bracket screw at center of main board.
: 3. carefully depress the outside edges of faceplate shield and tilt down.
: 4. unplug j4 and j5 and ribbon connectors j501 j502 and j503.
: 5. remove faceplate and logic board.
: 6. position board so microprocessor chip is on left and memory battery on right.
: 7. locate the 3 chip resistors at chips upper right..marked 104 and
: carefully desolder.
: 8. install the chip resistor at the 2 empty pads closest to memory battery.
: 9. reassemble carefully in reverse order.
: 10. test by entering freq. around 870 mhz.
:
: ==

Thanks for the mod. I'd like something cleared up before I attempt it, if
you will... The three resistors at the upper right of the CPU are all 104
in mine. Which of the three am I supposed to remove?

Thanks much,

Subject: Very Most Interesting

Real fine fellow you boys have in your amateur radio operator
club up there in the shadow of Mt. Hood. I understand he's
your PR man and possibly the Club mascot, too.

I can understand the mascot....everyone should own a monkey
or two, but for PR? Good grief!

This boy is something else, though. Real fine lad. Sets a
great example. Ask HIM, however, about getting a Size 13EE
crosswise up his grumpstump on the FidoNet a few months ago.
Yessiree, that boy done got himself booted in a parabolic arc
clean off the SCANRADIO forum where he was a very bad boy.
```

He's still smarting from that butt-kick and is one sore boy,
I'll tell ya what. Him and me had to go to the hospital on
three legs to get my foot extricated from his patooty.

Anyway, I just knew y'all would be proud of your lackey and
would appreciate hearing of his exploits here and about the
Internet.

Please tell the lad he's still invited to dinner. I have a
pair of smoking, steaming hot undershorts for him to eat, and
some sand for 'im to pack.

Fine fellow you have up there, that's fer sure. Conjecture around
these here parts has it that he bends over for you boys a lot.
Talk is that y'all call 'im "Bend Over Johnnie" when the lady
folks are out. Whooooooooooey.............

<snicker>

The subject says it all.

Quit writing to ISP's Bill. They are not as gull easily fooled
as some of the Fido ISP's you are used to.

Quit writing to us about you being in charge of your "domain". A
Fidonet Node or BBS is hardly to be considered a "domain". Besides,
it is giving people ideas. Already, I have heard of two people who
spoke to your provider by phone bitching about you.

Quit claiming you have dual masters degrees & the FCC commercial lic,
& teach ham classes. It's bullshit. You have some good knowledge &
should just rely on your basic knowledge/abilities. Don't try to
tell us all the other stuff because most of us know better.

Quit making up pissy little stories about people & pasting together

bogus messages about them. Only the most foolish of users are going
to believe it.

Quit trying to blame the bcheek@aol user on me. You know damm good &
well that I have access to enough anonymous servers that I don't need
to use an aol account. (although I did think it was pretty funny!)

Quit acting so pompus. Perhaps you don't realize it if pomposity is
a part of your personality. It is VERY annoying & perhaps you should
think about it. You are not any better than the rest of us. Treat
people the way you wish they would treat you, try putting yourself in
their shoes.

Quit taking swipes at people who take medication. At least they
are taking their medication & not a burden on society by living
in public funded hospitals.

Basically, stop being a prick. You do have some good info to share &
more people on Fido & internet would probably like you. This shit has
gone on for about 10 days & I KNOW are feeling weary by now.

This type of activity and flaming does not belong here Billy please
take your games somewhere else.

Like I've asked you some 40-50 times now.

Any one else that does not feel this belongs here? If so then
please email Bill with a copy of every message he posts that
you feel does not belong here (such as flams) and tell him
so.

It seems he's getting hundreads of emails and is trying to now
take it up with my ISP. ...good luck

Sorry for the public post but with such a reply I had to respond.
This is the end of this one. Back to email. I see a few more of
billy's messages that need a reply.

By the way Bill if you want to talk to my ISP their number is.

Bill - I got your postcard!!!!! I know you sent it because you told me to
pack sand just like you said above & because it is postmarked from
San Diego & because it is a a CB radio qsl card. Your web page says you
live next to Miramar Navel Air station (San Diego) & your web page shows
a picture of you & your butt ugly wife standing next to your 2000 GTL CB
RADIO. I even attached it here for all to see.

Thanks Bill, I laughed for an hour. We posted it on our group web page also.
Go look at what we say on HTTP://www.teleport.com/~mscott/dumb.shtml.

That card you sent was a great laugh.

Yea right. I have known of Bill Cheek (onilne) for quite sometime, just
not on THIS newsgroup which a arrived on about a week ago.

Why don't YOU try to contribute something to the group rather than kiss
Bill's ass.

> >Second, YOu have obviously not dealth with Bill Cheeks very much.=20
> Who IS this Bill Cheeks????? The person you might be refering to has
> a name, it is Bill CHEEK. As he is fond of saying, it is not Cheeks,

Ok FOOL, you are right I made a typo. Sorry.

=20
> Credentials are only as good as the work that comes from them. Bill
> has published several books (two of which I do own) and publishes

Yea yea yea, we hear from Bill all the time about how great he is &
teaching ham classes, having dual master's degrees, his FCC license, =
etc.
But he can't seem to provide ANY proof of these accomplishments. Hell,
anybody can get a book published. I could get a book published about
101 ways to wipe your ass if I wanted.

=20
> True I will admit I am not a professional in this industry, but I do

Obviously.

> I for one consider myself luck to be able to say that I have met Bill

Bullshit, I was just viewing the Scanradio echo a few days ago. It has
MINIMAL posts on it, very little traffic. It is not nearly as active =
with
the amount of helpful data like it was before you became GOD, & =

your "ZERO TOLORANCE" ploicy. When I say "minimal posts" like I listed =
above
crap like SEVERAL messages of what the secret service code names for =
Lyndon
Johnson, Prince Edward, & Frank Sinatra really only count as one thing,=20
especially when they were all entered by the same person.
=20
> Yes? Well, they're here because they can't be kicked off.

TRUE, & I'll best it really pisses you off.

> Don't you see what is happening?

Yes Bill we do see are that's why we are acting.

I have not seen the other people bragging about being "engineers" with
dual master's degrees, teaching Ham radio classes, & having an FCC =

license like Bill Cheek does. IF anyone conducted themselves like =
Cheek,
imagine we would hold them to the same scrutiny.

> happened to him and what a jerk I am for having the audacity to give

hahahhahahahahahahahaha, shit Bill you kicked EVERYONE off who you saw =
as
any kind of a threat to you or wouldn't kiss your ass. You would carry =
on

& be extremely condesending & make up stories to their sysop & whine. =
THen
you would tell them if they want to respond to do so via netmail & when
they did that you would tell the sysop they were harassing you. Get the
fuck out of here with your lies Bill.

> 'im the boot. Hell, I kicked his ass so hard, me and HIM had to go to
> the hospital on three legs to get my foot surgically removed from his
> grumpstump. He's still a little "sore"....if you know what I mean.
> <wink - wink - nudge - nudge>

I wonder what the Fidonet administrators would think of you bragging =
about=20
kicking people off like you are now?

Actually, there were rarely any flame wars or problems untill Bill =
Cheek
became the moderator. THEN, the problems started. Gee, Bill, maybe =
your
memory is bad. If you want I could e-mail you the messages I saved of
people telling you to STOP trying fix problems that weren't on there on
the echo. Face it Bill, you were just trying to get rid of ANYONE who=20
didn't think or act EXACTLY like you because you saw them as a threat. =
Do

you remember how many people asked you to put the moderatorship up to
a vote??? You refused, due to the policies of Fidonet, you were able =
to.

> Well, yeah, but that was due to the likes of ol' Hewbie Duffster and
> cronies who had the idea of sinking the whole forum. Once they got
> the boot, things settled down and the forum has become civil and
> friendly, not to mention educational and informational.

No Bill, the forum nearly sank because there was such little traffic on
it AFTER you became moderator that if you hadn't called in your little
buddies to help out & create traffic that it would have gotten kicked =
off
the backbone.

I STILL don't see anywhere near the amount of traffic on that echo that =
there
used to be before Butt Cheeks became the moderator. =20

Why can't you stop Lying Bill?

I suppose now you are going to complain to my sysop again. That shows =
how little
of a man you are.

Joseph - USE MARGINS OR LINE ENDS!!!!

I am sorry if you don't remember me being on the Scanradio echo. I kept =
a low key
profile most of the time. I don't remember you either. You are =
partially correct.
Ken Storm was the Moderator, then he left the echo with out a word or =
any trace of
what happened to him (he did the same to the CB echo which led to me =

asst moderator). I was there & saw it all. When the dust settled from =
Ken
leaving, Bill Cheeks became the moderator. For a while he was kicking =
out
a person about every other day. I was one of them. Obviously I must =
not have
been much of a bad guy or you would remember me. Bill kicked out anyone =
who was
a threat or didn't kiss his ass like he thought it should be. Perhaps =
you should
go back to where you belong (kissing Bill's ass or sucking him off) =
untill you
get your facts straight.

> I would like to know where this notion of 'Bill's buddies' kept the =
echo alive. Wake up and smell the
> Prozac.

Really? Then how the hell did Roger Cravens end up back on the echo?? =
THere were
other "Bill's Butt Buddies" too, like Blake & others. You better go. I =
think=20
the lack of oxygen from having your nose Bill's ass has schrewed up your =

thoughts & memories.

We can't all be wrong & you & "Bill's Butt Buddies" are right.

Sorry about that, too bad. :(I don't have an Internet e-mail address =
to
receive mail.

Regarding the idea about "knock off the crap", we told Bill that & it =
didn't do
any good.

Oh good one Billy.

I'll bet you have a sore mouth & brown nose.

I always figured that you kicked people off who didn't give into your =

wishes.

Oh yea Bill, you said earlier something about how you are the ONLY =

dedicated to scanner mods. What exactly are your credentials to call =

a "engineer"? Do you have an advanced degree in electronics & if so =
what
type? Do you have an FCC commercial license?? Maybe even a higher ham
license???

So yea Billy, thanks for the history lesson. That was nice.=20
But, as you said, it has NOTHING to do with this newsgroup, now back
to the original issue that "hduff" brought up. "YOU, Bill Cheek
are the common thread to these flames".

You're lucky. Most of the harassing, condescending, & liar type
of messages come from Bill (at least on Fidonet & many say here
to).

If you want me to post some examples just say so.

Oh Bill come on get off of it. I am not as dumb as your Fidonet
groupies. There is no way in hell that the government contacted you
wanting to know how to find me. (Even PrB said you like to use that =
line)=20

This is why:
I am registered to vote.
I have a drivers license.
I pay taxes to the Feds & state.
I have a license by the state & feds for a (recently) former profession.
I have 2 FCC licenses (my ham license was pointed out previously)
I have vehicles registered in my name
I have a state issued handgun which required an FBI check

THE GOVERNMENT WOULD HAVE NO PROBLEM FINDING ME, YOU ARE A LYING FOOL.

Surely, you don't think I would believe *YOU*. (especially with the
way you lie)

Hell, your tagline on Fidonet is a huge lie. (about you being a Win95
MS adivsor)
=20
> Can't help it for the time being. Hang in there.

This morning you wrote a message saying "fuck all you people" and=20

like "I've had enough". It sounded like you were leaving.

Oh yea, get it thru your head. I DO NOT HAVE AN INTERNET E-MAIL
ADDRESS. I only have a Fidonet account (you SHOULD remember that)
& I have NO intentions of getting an internet account. You & your buddy
can go ahead & contact all the ISP's you want by looking at the paths of
these messages. Have you ever heard of an anonymous news server??? =
(DUH)
I am really impressed that you guys figured out how to read thru a unix

box or enable headers with your browser. (I believe you are running
Netscape 3.0 beta 4 or 5, I can't remember for certain) Maybe next=20
you'll
learn how to set up an NT server on release 4 or something a little more
cutting edge like that.

Maybe we should contact YOUR ISP about your behavior here saying,=20
"FUCK all you people". It wouldn't take much to finger your ISP
and find out who the system admin is.

Yea right. I have known of Bill Cheek (onilne) for quite sometime, just
not on THIS newsgroup which a arrived on about a week ago.

Why don't YOU try to contribute something to the group rather than kiss
Bill's ass.

> >Second, YOu have obviously not dealth with Bill Cheeks very much.=20

Bullshit, I was just viewing the Scanradio echo a few days ago. It has
MINIMAL posts on it, very little traffic. It is not nearly as active =
with
the amount of helpful data like it was before you became GOD, & =

your "ZERO TOLORANCE" ploicy. When I say "minimal posts" like I listed =
above
crap like SEVERAL messages of what the secret service code names for =
Lyndon
Johnson, Prince Edward, & Frank Sinatra really only count as one thing,=20
especially when they were all entered by the same person.
=20
> Yes? Well, they're here because they can't be kicked off.

TRUE, & I'll best it really pisses you off.

> Don't you see what is happening?

Yes Bill we do see are that's why we are acting.

Bill Cheeks is an asshole. You have to have dealt with him to truly
understande his problems.

Actually, there were rarely any flame wars or problems untill Bill =
Cheek
became the moderator. THEN, the problems started. Gee, Bill, maybe =
your
memory is bad. If you want I could e-mail you the messages I saved of
people telling you to STOP trying fix problems that weren't on there on
the echo. Face it Bill, you were just trying to get rid of ANYONE who=20
didn't think or act EXACTLY like you because you saw them as a threat. =
Do
you remember how many people asked you to put the moderatorship up to
a vote??? You refused, due to the policies of Fidonet, you were able =

to.

> Well, yeah, but that was due to the likes of ol' Hewbie Duffster and
> cronies who had the idea of sinking the whole forum. Once they got
> the boot, things settled down and the forum has become civil and
> friendly, not to mention educational and informational.

No Bill, the forum nearly sank because there was such little traffic on
it AFTER you became moderator that if you hadn't called in your little
buddies to help out & create traffic that it would have gotten kicked =
off
the backbone.

I STILL don't see anywhere near the amount of traffic on that echo that =
there
used to be before Butt Cheeks became the moderator. =20

Why can't you stop Lying Bill?

I suppose now you are going to complain to my sysop again. That shows =
how little
of a man you are.

Joseph - USE MARGINS OR LINE ENDS!!!!

I am sorry if you don't remember me being on the Scanradio echo. I kept =
a low key
profile most of the time. I don't remember you either. You are =
partially correct.

Ken Storm was the Moderator, then he left the echo with out a word or =
any trace of
what happened to him (he did the same to the CB echo which led to me =

asst moderator). I was there & saw it all. When the dust settled from =
Ken
leaving, Bill Cheeks became the moderator. For a while he was kicking =
out
a person about every other day. I was one of them. Obviously I must =
not have
been much of a bad guy or you would remember me. Bill kicked out anyone =
who was
a threat or didn't kiss his ass like he thought it should be. Perhaps =
you should
go back to where you belong (kissing Bill's ass or sucking him off) =
untill you
get your facts straight.

> I would like to know where this notion of 'Bill's buddies' kept the =
echo alive. Wake up and smell the
> Prozac.

Really? Then how the hell did Roger Cravens end up back on the echo?? =
THere were
other "Bill's Butt Buddies" too, like Blake & others. You better go. I =
think=20
the lack of oxygen from having your nose Bill's ass has schrewed up your =

thoughts & memories.

We can't all be wrong & you & "Bill's Butt Buddies" are right.

You're lucky. Most of the harassing, condescending, & liar type
of messages come from Bill (at least on Fidonet & many say here
to).

If you want me to post some examples just say so.

Oh Bill come on get off of it. I am not as dumb as your Fidonet
groupies. There is no way in hell that the government contacted you
wanting to know how to find me. (Even PrB said you like to use that =
line)=20

This is why:
I am registered to vote.
I have a drivers license.
I pay taxes to the Feds & state.
I have a license by the state & feds for a (recently) former profession.
I have 2 FCC licenses (my ham license was pointed out previously)
I have vehicles registered in my name
I have a state issued handgun which required an FBI check

THE GOVERNMENT WOULD HAVE NO PROBLEM FINDING ME, YOU ARE A LYING FOOL.

Surely, you don't think I would believe *YOU*. (especially with the
way you lie)

Hell, your tagline on Fidonet is a huge lie. (about you being a Win95
MS adivsor)
=20
> Can't help it for the time being. Hang in there.

This morning you wrote a message saying "fuck all you people" and=20

like "I've had enough". It sounded like you were leaving.

Oh yea, get it thru your head. I DO NOT HAVE AN INTERNET E-MAIL
ADDRESS. I only have a Fidonet account (you SHOULD remember that)
& I have NO intentions of getting an internet account. You & your buddy
can go ahead & contact all the ISP's you want by looking at the paths of
these messages. Have you ever heard of an anonymous news server??? =
(DUH)
I am really impressed that you guys figured out how to read thru a unix
box or enable headers with your browser. (I believe you are running
Netscape 3.0 beta 4 or 5, I can't remember for certain) Maybe next=20

you'll
learn how to set up an NT server on release 4 or something a little more
cutting edge like that.

Maybe we should contact YOUR ISP about your behavior here saying,=20
"FUCK all you people". It wouldn't take much to finger your ISP
and find out who the system admin is.

Bill - I got your postcard!!!!! I know you sent it because you told =
me to
pack sand just like you said above & because it is postmarked from
San Diego & because it is a a CB radio qsl card. Your web page says you
live next to Miramar Navel Air station (San Diego) & your web page shows
a picture of you & your butt ugly wife standing next to your 2000 GTL CB
RADIO. I even attached it here for all to see.

Thanks Bill, I laughed for an hour. We posted it on our group web page =
also.
Go look at what we say on HTTP://www.teleport.com/~mscott/dumb.shtml.

That card you sent was a great laugh.

I guess Billy is getting a little hot under the collar. He is writing
e-mails to my ham radio club & their service provider bitching
about me. You are a fool Bill.

Perhaps I need to write to your ISP???

Like you really think my ham club would give a shit. Hell, they posted
your postcard on their web page. You remember, the postcard you sent me?
It was just a day AFTER you said that my mail gets returned and a day
before you told Duff to pack sand, your saying. (your postcard to me
to do that to)

I will attach the card for you and all to see incase you forgot.

Who are you to say what is to happen.

You arrived on seen, threated with snail mail bombs, posted comments about various family members,
and admitted you only had been on the thread 2 days.

Fanning the flames, you had no right to ever enter. Not once have you said anything about scanning. Do you even own a scanner?

Joseph

353. Ocean City NJ & Vic. Freqs?

Newsgroup: rec.radio.scanner

I have a Uniden Bearcat BC100XLT 100 channel programmable
hand held scanner for sale. Frequency range is
29MHz to 54MHz FM
118MHz to 136MHz AM
136MHz to 174MHz FM
406MHz to 512MHz FM
It has a search mode. Comes with rubber duck antenna, leather case,
charger and operating manual. Condition is excellent. $100.00

Message-ID: <32055128.3A24@io.com>
Source record: 227572

I subscribed to this newsgroup about six months ago in order to get information about scanning. It was OK for a while, but I have better things to do than deal with all the garbage about and from Bill Cheek and other such usless postings that I am unsubscribing NOW. It is a shame when newsgroups (not only this one) become childish battlegrounds.
I'm out of here! Good-Bye.

Gerald

356. New FCC antenna rules

Newsgroup: rec.radio.scanner
Date: 1996-08-04 00:00:00 UTC
From: "George Nelson, APR" <gnb@phoenix.net>
Message-ID: <32054BF9.572B@phoenix.net>
Source record: 227573
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I understand the FCC was set to issue new antenna rules under the new telecommunications act last week, which would eliminate landlord, neighborhood association and city zoning prohibitions against outdoor antennas. It was intended primarily to free would-be customers of the satellite TV services through mini-dishes, but the relief would apply to all antennas for receiving any telecommunications signals...including scanners. I'm told the FCC pulled the new regs at the last minute without comment. Anyone know why, or how much of the new rights we almost had we're going to lose?

Because the Shack doesn't build ANY scanners; they buy what they can get a good deal on. Some of the items sold at Radio Shack are top-quality equipment others are cheap junk. What it all has is common is that it's profitable to sell.
Some who post to this group have pointed out that the line doesn't make a good product mix. That is true; they don't design a line of merchandise that fits togeather well. They don't design a line of merchandise at all! They put garbage like `pettable portable' radios in the same stores where they try to sell some very good electronic equipment.

If you could have ONE receiver for all the frequencies you monitor which would you choose? Assume that the listener's interests are diverse; international SW broadcasters, hams on SSB, public safety VHF/UHF... perhaps also the local MW AM and FM broadcasters as well. Please consider sensitivy, selectivity, ease of use.

I have the Pro 51 and the Pro 60, I went yesterday to upgrade to the Pro-26 (trade in the 60) and brought it
back in 1 hour. I listen to aircraft and it was getting clobbered by cellular in the 120 to 130 range.. the 60
is a triple conversion, made by GRE I think. the 51 and the 26 appear to be made by Uniden.. the 60 is on sale
at 249.00 I wouldn't be without mine again.. Just my reflections.

They're in business alright. I've gotten replies to my queries about
the NY/NJ edition of Scannermaster. It's a whopping 38 dollars!!! With
prices like those, they're making a mint.

>batteries. Charging them in the scanner takes 16 hours, and I'd like
>to be able to do it in 3. I

That one's easy. You can't. The fastest recharge rate known to be safe and not eat batteries is the C/3 rate, which in your case means 700 / 3 = 233-mA. If you recharged at that rate for three hours, the cells would be about 75% charged, at best. I can't explain why in the purest sense, but simply stated, the efficiency of putting something back is never the same as taking it out.

That means if you drain those cells at 233-mA for three hours, and then recharge them at the same rate for three hours, you'll be 75% or so of the way there. The C/3 rate is good good for maybe 4-6 hours as opposed to the C/10 rate at about 14-18 hours.

>I'm planning on buying some new Nicads for
>my scanner, because these have been recharged thousands of times, and
>I've dome things that I supposedly shouldn't have, like using the
>scanner from the mains wih the batteries in, thus charging and
>discharging the batteries at the same time.

Why don't you first perform the simple test(s) listed in the middle area of the document I posted......the measurements of terminal voltage at full charge and then the settling period measurements. That will tell us a lot.

>1) What batteries should I buy? Do they have to be 700mAh again, or
>can I get higher capacity ones? I've seen adverts for those at
>1200mAh, but really don't want to risk my precious 8k getting damaged.
>At the moment I'm planning on getting another 4x700mAh.

So long as you choose the same physical size and general type of batteries, there is no inherent risk to the scanner. In this case, we're talking "AA" cells in NiCd or NiMH type. The risk lies in prematurely damaging those new cells if the original recharger can't handle them. I don't know how the recharge circuit of the AR-8000 is built, but it might could use a change of limiter resistor if you want to use the same recharger with a beefier set of cells. THAT was a major purpose of my article, you see.

If you can acquire a schematic of the AR8000 and send me a copy, I'll be glad to post specific data for the requisite mod. It would be worth looking into, since 1200-mA cells would give 60%-70% more service between recharges than 700-mA cells.

Chances are, the stock recharger could handle the job with a minor change of limiter resistors in the scanner's recharge circuit, but I would need to see the schematic to know for sure.

>2) I've seen a charger that claims to charge 700mAh in 3 hours. Is
>this safe to use?

Possibly. Provided that the cells are removed from the scanner and placed directly into the new charger. But I have trouble accepting that 3-hr claim. I mean, hey. you -=can=- recharge a set of NiCds in 15-mins, if you want to. (Never mind that their service life will be decreased from years to days!)

> It's an 8 cell charger/discharger and has a 20mAh
>trickle. I am unsure what this means.

20-mA trickle may be sufficient to keep the cells from "self discharging", but only barely. The C/10 rate is typically the standard "trickle" rate. Much less than that, and the cells could still self-discharge (internally).

>It says that for 700mAh
>batteries, it'll take 2hrs48mins. There is a cheaper 4 cell
>charger/discharger/trickle which does the same at uses a 380(???)mAh
>charge power??? I am unsure.

Well, the maximum SAFE recharge rate for 700-mA/h cells is 233-mA, the C/3 rate, but that rate will not do the job in three hours. More like four or five. So this hot-charger just does it at a higher rate, and probably plays the odds on C/3 not being EXACTLY the critical point for a majority of cells. Sounds like they may be using a C/2 rate.

Lab tests would show that a C/2 recharge rate would damage some cells in short order. The data is not readily available, but it is certain that some cells COULD withstand the C/2 rate and not be harmed. The risk goes up, starting at the C/3 rate.

>All I want to know, really, is what batteries to use, and what charger
>is safe that will only take 3 hours. I live in the UK, so don't
>recomment popping down to the local radio shack to get their model!

Ha ha ha ha. Well, so long as you are willing to take the risk on ruining a few cells, you can go for the C/2 rate. Look, suppose you had 100-cells. The C/3 rate is specified such that none of the 100 cells would be damaged after a series of recharges at that rate.

Now if you repeated that test with the C/2 rate, it is likely that 5 to 15 of those 100 cells would be damaged. The remaining 85-95 might go on indefinitely.

So long as you have a properly designed recharger, I'd be inclined to go for the 1200-mA/h cells unless you don't need the longer operating times. You may have to buy 8 or 12 700-mA cells to find four that will live in harmony with that 3-hr charger. The answers aren't all that clear, but for a modest cost, I'm sure you can handpick some cells that will withstand the higher recharge rates.

>Is this a result of the new rules that went into effect in April 1994, I
>wonder?

Good connection there, but I don't think there is a direct relationship. Or, if there is, then the REAL history goes back to the Electronic Communications Privacy Act of 1986 (ECPA) where listening to certain services was proscribed.

I'm sure these snippets play a role, but the real culprit is technology. Radio on all fronts is being eased into more of a back seat role than ever since its invention.

Cellular and satellite services are absorbing or will absorb a LOT of what we call "scanner signals" in the next few years. While cellular and satellite are definitely "radio", they are not the kind of radio that feeds hobby pursuits, and the government has made sure of that, if technology hasn't.

But there's more. Cable is a frontier yet....that has not matured to its potential. Wireline and fiber have not fully matured. And then there is encryption and spread spectrum. The sum and total of this advancing technology kind of conspires to render scanner signals a bit on the obsolete side.

It does seem that since April, 1994, there has been nothing overly exciting introduced on the scanner scene. There is a connection for you!

Not to worry, though, I think scanning holds some potential and excitement through the end of the century. But long term outlooks are not exactly orgasmic.......

>Bill,
>I have been following this newsgroup for about a month now, and all I
>have seen are your childish efforts to insult others.

No shit? THAT is ALL you've seen? Dang! Ummm, may I suggest you
make appointments with BOTH your proctologist AND ophthamologist?

You have a severe case of 'eye-rectitis'.

That's where your optic nerves get crossed up with your rectal nerves
and give you a shitty outlook.

>When are you going to grow up and quit being an asshole?

Sorry. "Asshole" is my middle name. I regret you had to discover
that so abruptly. I'd have told you, had you bothered to ask.

>GET A LIFE

THAT is one thing I definitely have, sir. A very fine one, at that.
I'd be glad to tell you about it sometime, if you're interested.

For right now, though, it is much more important that you get your
'eye-rectitis' cured up. If you let it go much longer, it will spread
to your olfactory nerves, and from there to your taste buds and then
the auditory nerves and finally to the rest of your sensory organs.

Eye-rectitis is a very debilitating disease, so please consult with
your doctors first thing Monday morning.

In the meantime, please understand that I have been "back" here for
only about two weeks, so your "month" seems a bit of an exaggeration.
Also please understand that a forger was at work for a time, posting
things in my name that I didn't write. You were definitely confused
by the time-frame, so you may have been sucked in by the forger, too.

(Who is no longer with us, I might add.) That doesn't change my
middle name, however, especially to those who go snooping around kinda
low where their noses don't belong.

Now settle down and go see your doctor.

These attacks/flames are childish. It makes me wonder if my "fellow" scanner enthusiasts are interesed in the hobby of scanning or the "art" of insulting. Bill Cheek is incredibly knowledgible in the area of scanning and I am very interested in what he has to say.

I would suggest that those who attack and flame him are jealous of his knowledge and the respect he has earned in this area.

To those who insist on attacking: anytime you see a posting from Bill Cheeks, just pass it by. Rely on your own knowledge (or lack thereof) of the subject.

DM>From: copper@cycor.ca (Dave Maxwell)
DM>Subject: TV antenna for scanners

DM>anybody have any ideas

From what I've heard from a couple acquaintences, the log-periodic type of broadband TV antennas should work okay. You will get a slight more signal by mounting it with the elements' axis vertical rather than horizontal; most scanner-listened-to transmitters have vertically-polarized antennas.

Rotated 90 deg. on the boom means that any signals to the "side" (perpendicular the the flat plane of the TV antenna) can be anywhere from 10 to 30 db down depending on the frequency. A TV antenna rotator might help if you want the directivity.

That isn't a 'bad' problem even if objectionable. That sounds
suspiciously like the microprocessor-controlled alternator-charging
system on my '82 Camaro. It's much worse on the HF band, trust me. :)

BC>>It's tune up time again, but last time I did a tune up, I used resistor
BC>>spark plugs and pretty good quality wires. Any suggestions as to a brand
BC>>or type of ignition parts that should be used on a '92 Ford Ranger 3.0
BC>>liter V6?

Nearly all U.S. cars made in the 90s have fairly quiet ignition
systems. A full cure with shielding is severe on both time and
wallet. Better solution is an external antenna somewhere in the back
of the vehicle. A trunk-lid or hatch lip mounted antenna is a
reasonable compromise to avoid punching holes in the vehicle body.

Does your Ranger have any solenoid-operated latches? Caution if so,
since those solenoids can give off a sizeable voltage pulse when the
power is released. My Camaro's hatch release solenoid produces about a
300 Volt spike of short duration. To protect my garage door opener
transmitter (permanent inside the dash), the opener's battery eliminator
has a 1N4006 series power diode, series resistor, and shunt 9 Volt zener
diode. Any mobile-operation scanner using car battery power could
use some spike protection from a 600 Peak Inverse Voltage diode in
series with the + line (anode towards battery, cathode towards scanner).
A 1N4006 is such a diode and has been around for two decades.
200 to 600 Volt spikes are common in older aircraft using 28 VDC systems
(lots of solenoids in aircraft like old DC-3s).

DM>reception sucks.It dosent perform near as good as the grove scanner
DM>beam.i was able to hear detroit 15o miles away on uhf with the grove,no
DM>such luck now any suggestions?

I almost hate to ask, but did you do a continuity check on the coax to
the antenna before raising it? The coax could have an open on the
center conductor. An ordinary volt-ohm-milliameter is all that's
required for that. Also, not all broadband TV antennas are coax
compatible but many of them include a balun adapter for coaxial cable
feedlines. Without that balun, there's a poor impedance match which
translates to a large loss of signal.

The most common type of 'new' (in the last 15 years or so) broadband
VHF-UHF TV antenna doesn't have much gain at UHF, typically only a few
db in the forward direction.

>J.W. Wolfington

TV antennas work VERY well "on their side" Which I presume to mean
vertically polorized. I usually cut off the longer elements, and I
use a balun for impedence matching. Just remember, they ARE highly
directional, so if you are looking for an omni-directional antenna,
just get a $15 Radio Shack scanner ground plane. BTW, these also work
great for two meters.

I have used my scanner on taxi and on landing/departure many times
without causing any problems..Although a scanner is a receiver, it's RF
oscillator does emit some RFI..not nearly as much as noisy Laptop computers!
CD ROM readers also emit some RFI. My scanner will receive from
0.5-1300mhz (no gaps) I also know of some people (rec.aviation.piloting
group) who use the scanner as a secondary receiver in their private plane!!

bcheek@cts.com (Bill Cheek) wrote:

Yes you can.

If you wish to buy expensive converters up or down converters
maybe such as the ones used in satellite tv receivers.

You tune your scanner to a specific frequency 140 mhz and tune
using the converter. But then a scanner really is not a scanner
anymore. But I don't think you will find much to listen to above
900mhz anyways.

If your looking for 800mhz reception, you can also buy converters
for this. You may be able to find more info in a radio type magazine.
Look for the small ads in the back sections. But they do not work as
good as a scanner designed to cover that frequency range.

If you really have the need to monitor cellular you can often add
the 'intermediate frequency' (IF) of your scanner to the frequency you
want to monitor. Most cases you will find that the same signal can be
heard on the sum of the two or difference of the two. Give it a try.
I think it may be 10.7mhz (or double that) in your radio.

Bill Cheek knows lots of little tricks like this I'm sure he may be
able to help.

Good luck.

I'm not sure about a spray but I know their is a metal based paint
available. I think It could be zinc. You can try the following two
stores in Toront Ontario.

Active Components 1-416-367-2911
or
Electro Sonic 1-416-494-1555

(FYI stores are closed on Monday its a civic holiday)

You did not say where you are so I can't suggest any other places.

Good Luck

>rest of us can only savor the distant memories from before
>the scanner groups became a subset of alt.flame.

WHO is this "we" and "us"? I've never done anything to you,
or said anything about you. What is your worry?

Ahhhhhhh, I seeeeeee, could it be that you want the liberty to freely
kick me like you kick your kids or poodle dog when you feel cranky and

out of sorts? And now you're pissed because I won't let you do it for free? Geez, doode, evreything in this world has a price.

I'm afraid I don't understand YOU and the horse you rode in on.

If you'd like to succinctly and matter-of-factly explain, I'll be glad to listen to what you have to say. But if you come around pissing and farting, it is very likely you will get pissed on and farted at in return. What is the problem with that? You want to talk scanners, we'll talk scanners. You want a peeing contest, we'll pee......

You COULD have asked me a scanner question; or told me something about scanners that I don't know. Instead, you galloped in on your high horse with ANOTHER off-topic addition to the flames that you claim you'd prefer to diminish.

Please DO explain. I'll be all ears.

I suggest that we just ignore the few who must bring the fight to this news group. I barely know that it is going on because I have added most of the offenders to my kill file. The only time I know it is still going on is when a person I have not added to my kill file responds in disgust to the garbage that goes on. I assume that most news readers have a way of filtering out posts from specific individuals so why not use it. I may miss some of Bill's technical articles and advise but I feel it is worth the cost. I feel he is just as bad as the others by responding and therefore don't bother with him either.

Just a few ramblings from another fairly satisfied user (thanks to my kill file).

John

>channels that have been locked out. It seems to be the worst when I
>haven't driven the car for a few days. This is very annoying as I have
>to reprogram in the freqs every time this happens.

This one just MAY be easy. I don't fully understand your power arrangement, but IF you have the power source plugged into the EXTERNAL POWER jack on the PRO-37, then two things are happening:

1. The PRO-37 internal batteries are disconnected from the scanner by a tiny microswitch in the EXT PWR jack, and

2. If the external source of power is fed from the car's switched side of the electrical system, then when you turn the key off, there is NO power applied to the scanner.

The PRO-37 does not have a conventional battery back-up "keep alive" circuit for the memory. Instead, it depends on a huge capacitor (C4) to provide memory power to the CPU and SRAM memory when power has been disconnected from the unit. As large as this capacitor is, 47,000-uF, it will discharge over a period of time. As it discharges down to the drop-out point of the CPU and SRAM memories, the first thing to go could well be custom programming such as the LockOuts, since they are stored in the CPU's RAM space; not in the external SRAM chip....which might have a lower drop-out point than the CPU.

One solution is to keep power applied to the PRO-37 at all times. That keep-alive capacitor is designed more for short periods of "power interruptus" than for long periods, such as a day or longer. So connect your external power source to the non-switched side of the car's electrical system and the memory loss problem will disappear.

As an alternative, keep a set of "AA" batteries in the scanner, and when you turn the ignition key off, unplug the EXT PWR plug from the side of the scanner, so it can get it's "keep alive" power from the internal batteries. This low current drain will not prematurely discharge the batteries.

>translates to a large loss of signal.

Very good point.....as was an earlier one about mounting the TV
antenna in the vertical plane. There is about 25-dB difference
between the vertical and horizontal planes. And 6-10 dB can be lost
by not using the balun/matching transformer.

>The most common type of 'new' (in the last 15 years or so) broadband
>VHF-UHF TV antenna doesn't have much gain at UHF, typically only a few
>db in the forward direction.

I haven't checked a new antenna recently, but because the UHF section
has to be broadbanded from 470 MHz - 890 MHz, chances are that section
of the antenna is a log-periodic variant, which by nature is lower
gain. However, a "few dB" translates to a LOT of gain over a discone
or omnidirectional antenna. We're looking at 6-8 dB there. Helluva
difference for a scanner where even a couple fo dB can make a
difference between hearing and not hearing.

Rgds,

Bill

I have a AOR 2515 and I have specific software for it but AR-2500 software works also. The AR-2515 is a Modified AR-2002. It was modified by ACE (who used to be AOR's American distributer. I have never had a plain 2002 or a 2500 to be able to talk about the differences. The AR-2515 has 2000 memories, a Freq range of 500-1500 Mhz and the data port on the back that uses the same protocol as the AR-2500. If other people have info on these differences I would be interested in following this line. I would appreciate it if you would either post the replies here (as I have) or sent a copy to me by Email.
Thanks!

"Uncle L" <shame19@csra.net> asked:

> Is there a way to add all the frequencies to my Radio Shack PRO-2026
> scanner that did not come with it. Not only the cellular, but also the
> military frequencies, satellite frequencies, etc.?

bcheek@cts.com (Bill Cheek) replied
:
>>No. If it were possible, the manufacturer would have done it.

ronkatz@interlog.com (Ron Katz) contradicted:

>Yes you can.

> If you wish to buy expensive converters up or down converters
>maybe such as the ones used in satellite tv receivers.

==========

While true, in the theoretical sense, a reply like the above merits
the citation of one or more practical and specific examples of
hardware, together with a source of where he can get the item(s) to
which you referred.

You gave him nothing to go on at all, which either makes him clam up
feeling unsatisfied, or come back with more questions, thereby
increasing the forum bandwidth.

But now that you mention it, -=I=- am curious as to exactly WHICH
converter will do as you say for the PRO-2026 and where it can be
obtained, and for how much? Remember now, HE ASKED for not only
cellular, but also military, satellite, etc.

>Bill Cheek knows lots of little tricks like this I'm sure he may be
>able to help.

I stand on my original reply. The answer is NO. There is no way to
"add all the frequencies that did not come with it." There is no
practical way, and any theoretical way is out of the question in terms
of cost versus value. Like adding gold plumbing fixtures to a
ramshackle hut in the Kalahari Desert.

>Good luck.

He will need it, if he's inspired by your reply.

>Ron Katz
>News Cameraman

You will notice that I have not (yet) questioned the genetics, academia, and other qualities of the 'News Cameraman' profession. Do take note that I have not done that.

I am STILL waiting for a dissertation from you, including evidence, to support your emphatic allegations of recent times.

There is no "extra cost" software anymore. It's all included, in one fell swoop, for all the scanners that are supported. Other scanners are added in the support queue on a request basis, provided the user is willing to be a major player in the obviously necessary beta period of development and refinement.

There could well be modest "extra cost" installation manuals for other scanners, but that's really not significant.

>171.845, 171.905.

Yes you are right, most wireless mikes work on these channels. BUT
many television and radio stations are also licensed for remote
broadcast frequencies which they use for transmitting audio or
audio/video back to the studio.

I have seen serveral who used these channels in their wireless mikes.

Check the remote broadcast channels.

A lot of times when they say "call me public service" and other
references to public service - they are talking about using the
telephone so you can't hear.

If you're lucky, you might pick them up on cellular, as some police
carry those now. Not that this is legal to do, just for information
purposes only.

Tell us a little about your homebrew scanner. I'm curious that you have one, because although I can think of several ways to make one work it seems to me that most of them would cost *more* than a cheap, used scanner. Evidently you feel (felt) that your way was better than buying one at that point.

So how is your homebrew rig set up?

BTW... my suggestion for a 'ready-built' is to get a used PRO-43.
I've got one and it's a great scanner... covers almost everything.

You are correct here I made a mistake. Good one Bill. Your listening
for a change.

>>and loose less energy when charging but do not hold
>>much charge)
>
>A 1-farad capacitor can hold enough charge to spin your eyeballs like
>a slot machine.

Yes that's correct but for a very short period of time. Compare it to
a battery of equal size, let say, or even one much larger one and it
will still not have the reserve like a battery will.

A capacitor stores electricity. It does not produce it.

>
>>Remember you do not get everything you

good your understanding I see. But where you failed is that
we just said the same thing. Or at least your trying to say the same
thing.

>The correct explanation of a recharge process is that the
>electromotive force of the battery must be "overcome" by a counter
>electromotive force.

Don't confuse people here Bill, you don't have to impress anyone. You
can use the word Voltage not everyone knows what EMF is.

In other words your overcoming its resistance. Same thing here Bill.

Its like trying to move a car. You can like I said, push harder and
the car will move.(voltage) Or the way your saying it, let your
foot off the brake a bit and it will also move. (resistance)

> Resistance is NOT a part of that equation,
>except for the RATE of the recharge.

WRONG. It is part of the equation.
I'll try and put this in a way you can understand Bill.
Bill what you fail to understand is what resistance is. Resistance
can be in the form as an opposite charge. Its like the car pushing

back it you when someone presses the gas pedal as your tying to push it away from you. You are trying to push this car up hill but until you can overcome its resistance its not going anywhere. Again is it lowers the resistance or you increase your pushing then you will overcome it. Just like charging a battery. Your pushing it up hill. When it is at the top of the hill and not resting against you while pinned against a wall then it has some energy to release as it rolls downwards. Can you see the relation to charging a battery?

I'm beginning to think you copied your material from some book and did not fully understand what you were talking about.

>
>> Remember that one of the reasons that heat is generated is
>> because of the internal resistance?
>
>Yes, that's called "I-squared-R" loss. Loss, because heat is
>conducted, conveyed, radiated, and lost.

Oh it is, is it? What your saying is it is power loss.
No kidding eh? I thought I said this before.

P=v*i P=I-squared-R so what? ...What your getting at?..
stick with me here Bill, your fading on me.

>> This is why a battery becomes warm when charging. Increasing the
>>applied voltage or lowering the battery internal resistance
>>causes more current flow. As a result more heat is also generated.

>
>A battery's internal resistance is the dependent variable of the
>equation. You don't control it directly. It's a lot like shit.
>It just happens.......
>
Yes that is correct but in order to understand what happening it is necessary to point this out. We all know that we can not change the battery resistance what I said help think it through. I see it helped you....I got the "not bad" approval.. Thanks Bill

By the way we can change the battery resistance. By changing the level of charge in it. By changing the battery temperature.

>> To charge a battery, current should be maintained
>>at a certain level in order for the chemical reaction
>>to take place.
>
>At.....or in excess....of a "certain level.......
>
>> You can not control the internal resistance of the battery,
>

>Very good. Sort of. You can.....by charging or discharging it.
>
>> but you can control the applied voltage to the battery
>> which will change the current.
>
>Good. But you can control the current, too, which will change
>the voltage. You can do one or the other or BOTH.
>

Wrong Bill. Current is a product of voltage divided by resistance.

by changing the current it would mean that the voltage WAS changed OR
the RESISTANCE changed.

Current is the result of one or both changing.

Its like saying I can change the water coming out of the tap.
Yes you can if you increase the tap pressure or open/close the tap.

The amount of water flow (current) depends on the resistance in the
tap (open or closed) and the water pressure (voltage)

Would you like me to mail you a book on "Electricity Basics"? It is
from my junior high school days. Maybe it can explain it in terms you
will understand better.

>> Again, you can lower the current by lowering
>>the voltage or the opposite to increase the current.
>>It is this voltage control that helps to makes up a good
>>charging system.
>
>No. That statement is very misleading. Voltage control only makes
>for a passable "consumer electronics" charging system. A GOOD
>charging system has BOTH voltage control AND current control.
>

Do you know how current is controlled? By increasing resistance.

Do you know how current can be measured? By passing it through a
resistor and measuring the voltage drop.

You are forgetting what current is.

>>For Nicad batteries it has been found that 1/10 of the
>>current capacity of the battery for a period of about
>>12-14 hours is around the correct charge rate for efficient
>>charging. (this chemical reaction to occur with minimal
>>loss of heat)
>
>Heat from the chemical reaction is negligible. I-Squared-R loss is
>the predominant source of heat generated within the cell. (That's
>current, squared, multiplied by the resistance.)

What you see to be trying to say is "power loss is the cause of heat"

No kidding! Heat is caused by resistance ..I don't know how to say
it any simpler Bill. And yes we all know "I-Squared-R" is the
equation to figure out power...get off of it.

>
>>Any faster and it does not become efficient
>>any more. Also note that heat also speeds up chemical
>>reactions.
>
>That is only a general rule; not an absolute. Heat does not affect
>some chemical reactions, and it "confuses" others.

This IS one factor that effect the charging of a battery. I'm not
going to get into "some chemical reactions" we are talking about
batteries here.

> For instance, all
>materials have a temperature coefficient. Most are positive. That
>means that as temperature increases, so does resistivity. So you
>cannot make a bold claim that heat speeds up the reaction, because it
>can, under many circumstances, slow the reaction.

Bill we are talking about batteries here not the temperature
coefficient of other materials. Stick to the point.

> This is notably
>true in electronics where resistivity of the material is a factor.
>
>> This makes charging more difficult because
>> of this changing characteristics of the battery during
>> charging.

>SAY WHAT????? Yo Katz? Knock - knock. Anybody home? Lead acid
>cells, like ALL batteries, have lowered internal resistance as they
>are brought up to charge.

Oh really now? So if I get close to a full charge of lets say a
gell cell battery the resistance will drop? If this is the case
then Current will rise. The battery will never stop charging.

Ever monitor the current and voltage of a charging gell cell battery?
Notice you have to increase the voltage when the current drops during
charging? Its because something has changed. Gee Bill what can that
be??!!? Well the voltage has stayed the same. The current dropped..
what left?...Resistance. You do the math Billy. Is very basic
electricity here. Resistance has increased. This happened during
charging.

What school did you come from? Did you say in one of your posts that
you are an Engineer. Is that an Electrical Engineer? You don't do
house wiring do you? Seen any good fires lately?

> Whatthehellareyoutalkingabout??????

Something you seem to have great difficulty understanding for a
Engineer.

>Whatcha been drinking tonight, Tooth's? Foster's?

I have heard NORTHSTAR dispatched on 155.295 I believe that they are
based in Morristown.

For Landing zone coordination they typically use the local FD frequency
since the FD is responsible for setting up the landing zone.

Eric

Hi there.

I'm trying to locate the frequency used by the
Aviation Rescue and Fire Fighting Service at Cairns airport. It is
different than the national allocations.

Anyone help?

There has been some discussion on the ham newsgroups about the
noisy nature of the fuel pump on the Ford Explorer series. Perhaps
your truck uses the same system.

This complaint has mainly been posted by people trying to operate on
the HF (shortwave) ham bands and complaining about the noise there, but
it's possible that it could manifest itself on the UHF/VHF scanner
bands also.

Ford has a filter they sell for the fuel pump, but reports are that the
fuel pump is hard to get to on the Explorer (read: expensive).

If this sounds like this might apply to your situation, check out the
Deja News website and search for "Ford Explorer", or post your query on
a couple of the ham newsgroups:
rec.radio.amateur.equipment or maybe rec.radio.amateur.misc

I have a Garmin 45. Works OK in CONUS, but when I took it to Tanzania where I really wanted it to work
It would not pick up anything. Yes, I reset the "map" setting. It really ticked me off that the unit did not work. Also there is no way of testing it [that I know of] for a remote location like Kenya and Tanzania till you are there. Then it is too late!

Jay (et al):

I would stongly suggest you pick up the latest edition (3rd) of a book entitled "Monitor America". There is a section for the city of Montgomery and it includes freqs, codes, and ten-signals.

I'm not sure that you have any good radio related shops around you, but you should be able to order the book from many of the mail order houses that advertise in the scanner mags or you can call ScannerMaster, the publishers, directly at 1-800-722-6701.

Hope this helps....

Sorry Mike, no can do. The only way back is to reset the entire unit, unfourtunately this includes blanking all the channels. Something like push and hold manuel, 1, and 9...then turn it on. (Others help with sequence please). Good luck!

462. Trunked systems ripe for terrorism?

Newsgroup: rec.radio.scanner
Date: 1996-08-05 00:00:00 UTC
From: Brian Varine <varineb@ucs.orst.edu>
Message-ID: <Pine.OSF.3.91.960805214510.29205C-100000@ucs.orst.edu>
Source record: 227422

Is it me or do trunked systems seem ripe for some sort of attack? Since they all have one control channel, seems all you'd have to do is take a decent 1000 Watt Xmitter and apply a bunch of noise or micro bursts to the control channels data stream and *poof*, trunked radio failure. I know that most have the back up "failsoft" system but Portlands didn't work when it went down and many others have shared the same fate. If you were some sort of terrorist or high speed criminal, it wouldn't cost to much to build something that could do the trick. Imagine OK City if their 800MHz was blasted off the air? Do agencies have any sort of plan for this type of attack? Any ECCM in trunked systems?

The one I saw was on TV. They had a function on it where you punch in a
zip code and it lets you select the freq's you want to hear. It also had
like 20 or so channels that you could program in. It actually looked kind
of cool, but it's illegal to listen to scanners in your car in MN (Unless
you have a BCA or an FCC permit), so I didn't buy one.

>Discharge an AA penlite through a flashlight lamp. It doesn't
>get hot as the cell approaches zero voltage.

Of course not!! Elementary, dear Watson. The cell's internal resistance increases as the terminal voltage decreases. Therefore current drain into a passive, resistive load steadily decreases over the course of a discharge.

On the other hand, if you connected six or eight cells in series and fed them into say a 5-v regulator and applied a load to the regulator output that was near the limits for cell discharge rates, then as terminal voltage drops and cell internal resistance increases, the

SAME current would continue to flow until the regulator drop-out point was reached, but that might be much too late. The power dissipated in the cells could thus, increase......and heat will result.

:-)

No, I doubt Mr. Ford, whom I know well, as we are both in TBARC, would appreciate being called the CO. He is the Commander of the Ham Radio Posse. The term CO was bestowed upon me by him. That stands for Civilian Observer.

A few years back I was monitoring the local news cueing feeds on UHF (listening for traffic updates) and overheard several of the helicopter pilots talking about a news story everyone was setting up to report. It seems there was a large country-western outdoor music fest that weekend (in the Phoenix, AZ area) and it was being played up by the local news. Apparently the newschopper guys are not C/W fans as they made several unkind remarks about the attendees, punctuated by "shoot-howdys" and "Yeeehaws." I guess they don't realize that others can hear them...I think there would be several unhappy people had they overheard this broadcast, especially those "sh*tkickers," the pilots referred to. (g)

The heat generated by the chemical reaction in a NiCd cell is
negligible for all practical purposes. The predominate quantity of
heat within a NiCd cell is caused by I-squared-R.

> A battery is not a perfect storage device, because it
>has resistance. (Capacitors have much less resistance

Incorrect. Capacitors have extremely high resistance, better ones
bordering on infinite. (Upwards of hundreds of megohms)

>and loose less energy when charging but do not hold
>much charge)

A 1-farad capacitor can hold enough charge to spin your eyeballs like
a slot machine.

>Remember you do not get everything you
>put into the rechargeable battery. You lose some energy
>as heat also because of its internal resistance.

Capacitors do not lose energy except by two means: discharge through
a resistive path, and/or leakage across the dielectric. The leakage
is, for all practical purposes, negligible unless the capacitor is
defective. Capacitors are passive storage devices. Batteries are
active storage devices as well as energy "converters".

> A battery is an electrical storage device that
>produces electricity from a chemical reaction. In
>order to pass current through the battery and cause
>this chemical reaction that makes the battery charge,
>you must over come its internal resistance. This is
>done by increasing the applied voltage.

That is grossly incorrect. Resistance is just as easily "overcome" by
a millionth of a volt as by a million volts.

The correct explanation of a recharge process is that the
electromotive force of the battery must be "overcome" by a counter
electromotive force. Resistance is NOT a part of that equation,
except for the RATE of the recharge.

> Remember that one of the reasons that heat is generated is
> because of the internal resistance?

Yes, that's called "I-squared-R" loss. Loss, because heat is
conducted, conveyed, radiated, and lost.

> This is why a battery becomes warm when charging. Increasing the
>applied voltage or lowering the battery internal resistance
>causes more current flow. As a result more heat is also generated.

Not bad. However, I'd like to see you increase or decrease a cell's
resistance at whim and fancy like adjusting a variable resistor.

A battery's internal resistance is the dependent variable of the
equation. You don't control it directly. It's a lot like shit.
It just happens.......

> To charge a battery, current should be maintained
>at a certain level in order for the chemical reaction
>to take place.

At.....or in excess....of a "certain level.......

> You can not control the internal resistance of the battery,

Very good. Sort of. You can.....by charging or discharging it.

> but you can control the applied voltage to the battery
> which will change the current.

Good. But you can control the current, too, which will change
the voltage. You can do one or the other or BOTH.

> Again, you can lower the current by lowering
>the voltage or the opposite to increase the current.
>It is this voltage control that helps to makes up a good
>charging system.

No. That statement is very misleading. Voltage control only makes
for a passable "consumer electronics" charging system. A GOOD
charging system has BOTH voltage control AND current control.

>For Nicad batteries it has been found that 1/10 of the
>current capacity of the battery for a period of about
>12-14 hours is around the correct charge rate for efficient
>charging. (this chemical reaction to occur with minimal
>loss of heat)

Heat from the chemical reaction is negligible. I-Squared-R loss is the predominant source of heat generated within the cell. (That's current, squared, multiplied by the resistance.)

>Any faster and it does not become efficient
>any more. Also note that heat also speeds up chemical
>reactions.

That is only a general rule; not an absolute. Heat does not affect some chemical reactions, and it "confuses" others. For instance, all materials have a temperature coefficient. Most are positive. That means that as temperature increases, so does resistivity. So you cannot make a bold claim that heat speeds up the reaction, because it can, under many circumstances, slow the reaction. This is notably true in electronics where resistivity of the material is a factor.

> This makes charging more difficult because
> of this changing characteristics of the battery during
> charging.

The issue there is very clear, too, but not as you proffered. To charge a battery, an EMF must be applied that's greater and opposite to the EMF of the battery. Once that condition is met, then a given current flow will commence, and the battery will begin to charge.

But as it charges, the difference in potential between it and the applied EMF decreases, which decreases the current flow, which decreases the charge rate. A plot of that curve will be shown to be a logarithmic decay, generally to the natural base, epsilon.

> Higher capacity batteries often have a lower internal
>resistance. When charging with lets say a low power
>charger what happens is you exceed the current capabilities
>of the charger, damaging it.

THAT is quite rare. Very rare. The only time that would happen is if the recharger were marginally designed in the first place.

> You will often notice your charger getting too hot
> if this is the case. Parts in your charger were designed
> to dissipate a certain amount of heat but when you exceed
> the chargers capabilities you destroy it from excessive heat
> and from the increased current. Just like the opposite if
> you exceed the limits of your batteries while charging.

THAT quite depends on the charger and several other factors. Most consumer chargers are just an AC adapter cube with a "filtered" DC output. These rarely are damaged, even under abuse. But even self-respecting chargers don't destruct under overload all that often because they are designed to either handle overload or to drop out under excessive conditions.

> By the way sealed lead acid batteries I found
>are a much better choice.

Yes. Stick some in your PRO-43 or AR-8000 handheld scanners.

SAY WHAT????? Yo Katz? Knock - knock. Anybody home? Lead acid cells, like ALL batteries, have lowered internal resistance as they are brought up to charge. Whatthehellareyoutalkingabout?????? Whatcha been drinking tonight, Tooth's? Foster's?

>Only draw backs is that lead acid
>is heavy and lead is unsafe for the environment.

Just the lead is heavy. The acid and the lead are unsafe.

> For Nicads they will also increase in internal
>resistance but as they become charged close to the
>end of the charging cycle something happens.

Yeah. You woke up with post nasal drip.

> The internal resistance drops causing an increase in
>current charging the battery This causes heat,faster reactions,
>over charging, finally destroying the battery if not stopped.

Good grief, Katz! Which turnip truck did you just fall off of?

As a NiCd charges up, true, it's internal resistance drops, but its terminal voltage increases to oppose the applied EMF, thereby regulating current flow to a decreasing level from whatever it was at the start of the recharge cycle.

> Nicad Smart chargers sense the drop in battery
>internal resistance and shut off at this point. This
>is how the charger knows a nicad is charged.

Hogwash! Rubbish! Balderdash! Smart chargers use a special kind of op-amp called a "comparator" which compares a reference voltage to a variable voltage. When the variable reaches the reference, a logic output shift occurs, which either biases a relay or solid state switch to the off position or it feeds a microprocessor that commands a switch to drop out.

What "CB Legends and Lore" book have you been reading, Katz?

> Many basic chargers do not sense this.

Most do not.

> This is why time limits are set as to how long the battery
>should be left on charge. They also assume that the
>battery is fully drained before charging.

No, Katz. As I explained in my article, typical consumer electronics applications use a DC source to feed the NiCd pack through a series diode (avoids reverse polarity damage) and a series resistor (self-limits the C/10 rate). This is a very cheap, but very safe method for general purpose recharging. The only liability of such a mass produced concept is that the NiCds don't reach 100% charge because of conservative designs.

> You can charge batteries faster but not as efficiently.

How do you know? I don't. At least I don't know the peak of the "Bell Curve" that would define the efficiency curve of a charge function. It's fairly certain that it wouldn't be either the C/3 or the C/10 rate - probably some point in between, but that would have to be empirically determined.....it's not something you "just know".

> More energy is lost to heat. What do
>I care you ask? Well, your not fully charging the
>battery and your shortening the life of it by excessive
>heat and in many cases your boiling it....That's how
>I see it.

Well, Katzenjammer, you may see it that way, just as you "see" and claim I started flames and attacks betwixt thee and me. But as you are dead wrong and erroneous about that, you are wrong and in error on MUCH of your post above. Some of the crap you spouted could well do a grave disservice to those who try to apply your tomfoolery.

>Just my 5 cents worth.

That's about right in this day and age of $10 inflation.

>Ron Katz
>News Cameraman

Mayhaps you should stick to dispensing legends and lore about video photography, CCD's, image orthicons, focal lengths, aperature, and f-stops. Might do a little better and not err so raunchily.

IMHO, of course.

The product that you are referring to is known as
"BLACK BOX " Spray. It was developed for use by the
military and the CIA to prevent any signal leakage from
"black boxes" handling classified secret information.

It is available from PRO DISTRIBUTORS @
800-658-2027 and I think it sells for about $30 per aerosol
container. One container will cover 12-15 sq feet and will
provide 30-50 db of signal attenuation.

The spray is designed to prevent signals from either
entering or leaving the unit which has had the spray applied
to the case. It can be applied on metal, plastic, glass, wood,
or any type of electronic enclosure. I have found that it is
very effective in stopping computer hash heard in my
receiver and also in stopping Radio Frequency Interference
to various electronic devices.

Hi,

If anyone has a list of Police Districts in Ocean County I would greately appreciate it. I can trade the Fire station info, which I am pretty much current on.

If you are not aware, Ocean County NJ has just installed a Motorola Trunked Radio System (Smartnet II) for County Police Dispatch, Sheriff, and Prosecutor's Office. The system is unique since it uses 506/508 Mhz frequencies and not the typical 800 Mhz, normally associated with trunking.

So far, I have logged the following Talkgroups on the system:

0120 CHAN #? County Dispatch (Zone ?)
0140 CHAN #? County Dispatch (Zone ?)
0160 CHAN #5 Car-to-Car
0180 CHAN #? Car-to-Car
0320 CHAN #? Sheriff Department
0580 CHAN #? Prosecutor Office?

This is preliminary, since signals into Camden County (from Ocean) vary. Also, interference from Delaware County PA (they share some frequencies) can override the control channel and voice channels, making the logging difficult.

Joe

Hi all!
I just purchased a Uniden Sportcat 150 to replace my 100XLT for the added benefit of 800mhz coverage and increased scan rate (100 vs 16!)

My only complaint so far is that the audio output is much lower than the 100XLT. I never had trouble hearing the 100xlt, but this Sportcat is tough. I typically use it outdoors (car, beach, etc) Even at home, if I'm not sitting very close to the scanner, the sound isn't clear enough or loud enough to make out what's being transmitted. The 800mhz frequencies seem to be weaker in general as well, which just compounds the problem.

I'm considering purchasing an external amplified speaker and plug it into the headphone jack for home and/or car. Will this work? Will it clear up and increase the volume of the transmissions? Can the handheld support this sortof workaround? Any suggestions are quite welcome!

Thanks!

The following, from my archives, might be of interest:

From: kennish@kabuki.EECS.Berkeley.EDU (Ken A. Nishimura)
Subject: Re: Best AA NiCads? (NiCd batteries in general)
Date: 16 May 1994 21:52:38 GMT
Organization: University of California, Berkeley

I have yet to see a Ni-Cd battery that CANNOT be quick (1 hr)
charged. The issue is not charging, but overcharging. Batteries
differ greatly in their ability to withstand abuse due to
overcharge. I bet those RS cells can be quick charged in 1 hour,
but I wouldn't overcharge them one bit, since they would probably
vent or explode. Charge control is the key to battery management.

Let us review once again why Ni-Cd batteries behave this way. Ni-Cd
batteries take charging current very easily -- too easily for their
own good. Hence the need for constant current charging rather than
constant voltage, as they would take too much current and destroy
the charger or themselves due to the huge currents. There are other
reasons for constant current which I will get to in a second.

The positive material is nickelic (Ni+3 or Ni+4) hydroxide when charged,
and nickelous hydroxide when discharged (Ni+2). The negative plate
is cadmium metal when charged and cadmium hydroxide when discharged.

As long as there is uncharged material left on the plates (i.e. nickelous
hydroxide and/or cadmium hydroxide), the charging current goes to
work and produces the nickelic hydroxide or cadmium metal as desired.

When the cell reaches full capacity, the charging current has to do some work.
Since the plates are fully charged, the work goes to split water,
a component of the electrolyte. Now, splitting water involves
producing hydrogen and oxygen. This is bad, since this is explosive
and keeping it in a sealed cell (even with vents) is NOT good. So,
the battery manufactuers got smart....

The negative plate is bigger (electrochemically) than the positive electrode,
and when manufactured, is slightly discharged. This means that the positive
plate is reaches full charge first, and generates oxygen gas. This oxygen
gas then migrates across the separator to the cadmium negative plate,
and reduces it, forming cadmium hydroxide, which keeps the negative
plate from reaching full charge. Under these conditions, the

cell can remain on charge ad naseum. The bottleneck is the diffusion of the oxygen from the positive to the negative plate.

Under high currents, so much oxygen is produced at the positive plate that all of it cannot diffuse across to the negative plate. This is bad for several reasons. First, there is pressure build up. Second, since there is a limited amount of oxygen diffusing across, the amount of cadmium hydroxide being produced at the negative plate is limited. So, some of the current actually goes to convert the "excess" cadmium hydroxide to cadmium. When this happens, hydrogen is produced at the negative electrode. Pressure builds up and the cell vents. Once that happens, you are effectively losing water from the cell and the cell is permanently damaged. How badly depends on how much water you lose.

Battery manufacturers are doing all kinds of tricks to outsmart the average user to prevent him/her from killing their cells. Newer fast charge cells use activated carbon to act as an oxygen sponge to prevent high pressures from building up and to facilitate diffusion of oxygen to the negative electrode. The cost of this is that the carbon takes space, and that means less active material. So, for a given technology, rapid charge cells of this type will have a lower Ah capacity than other cells.

Gas management is the key to withstanding overcharge. The better the ability to absorb the oxygen and deliver it to the negative plate, the more overcharge current it can handle. Of course, the generation and recombination of oxygen through the overcharge current creates heat, which is bad. You will note that Ni-Cd cells remain cool, even with high charge currents, and then quickly get hot as full charge is attained. If your cells are hot, then you have overcharged them -- slap yourself in the wrist.

In a quest to increase the Ah capacity of the cells, manufacturers are using sponge or foam electrodes. You get 20% more capacity out of these cells than regular sintered plate, but the cost is higher internal resistance. They do not perform well under high drain (i.e. transmitting) conditions. I believe that the Millenium cells are of this type. This would explain the apparent higher capacity under low drain conditions. The new Panasonic 900 mAh and the soon to be announced 950 mAh AA cell from Sanyo are of this type.

For best high drain performance, stick with the sintered plate. The capacity champ in this category is the Sanyo KR-800 AA cell, 800 mAh.

Stay away from hi-temp cells, unless you really have hi-temp, as the electrolyte is NaOH and has a higher resistance, again leading to poor high drain performance.

Memory effect:

Does it exist? YES.
Is it easy to reproduce? NO.

Whenever Ni-Cds don't perform up to snuff, the excuse is "memory effect."

Originally memory effect was seen in spacecraft batteries subjected to
a repeated discharge/charge cycle that was a fixed percentage of
total capacity. After many cycles, when called upon to provide the
full capacity, the battery failed to do so.

Memory can be attributed to changes in the negative or cadmium
plate. Recall that charging involves converting Cd(0H)2 to Cd metal.
Ordinarily, and under moderate charging currents, the cadmium that
is deposited is microcrystalline (i.e. very small crystals). Now,
metallurgical thermodynamics states that grain boundaries are high
energy regions, and given time, the tendency of metals is for
the grains to coalesce and form larger crystals. This is bad
for the battery since it makes the cadmium harder to dissolve to
produce the discharge current. Hence you get "reduced capacity" or
more precisely, a voltage depression due to increased resistance.

The trick to avoiding memory is avoiding forming large crystal
cadmium. Very slow charging is bad, as slow growth aids large
crystal growth (recall growing rock candy). High temperatures are
bad, since the nucleation and growth of crystals is exponentially
driven by temperature. The problem is that given time, you will
get growth of cadmium crystals, and thus, you need to reform the material.

This does NOT mean that you need to cycle your battery each time you
use it. This does more harm than good, and unless you do it on a per
cell basis, you risk reversing the cells and that really kills them.
Perhaps once in a while, use your pack until it is 90% discharged,
or do a cell voltage of 1.0V under light load. Here, about 95% of
the cells capacity is used, and for all intensive purposes, is
discharged. At this point, recharge it and that's it.

The more common "memory effect" isn't memory at all, but voltage
depression caused by overcharging. Positive plate electrochemistry
is very complicated, but overcharging changes the crystal structure
of the nickelic hydroxide from beta-Nickelic Hydroxide to gamma-Nickelic
hydroxide. The electrochemical potential of the gamma form is
about 40 to 50 mV less than the beta form. This means that you get
a lower discharge voltage. In a six cell (7.2v) pack, this means
a loss of 300 mV. Trick? Don't overcharge. Leaving cells on a
trickle charger encourages formation of gamma NiOH. Expect your
cells to discharge at a lower voltage.

Summary:

DON'T deliberately discharge your batteries to avoid memory
DO let your cells discharge to 1.0V/cell on occasion through normal use.
DON'T leave your cells on tricke charge for long times, unless you can
tolerate voltage depression.
DO protect your cells from high temperature both in charging and storage.
DON'T overcharge your cells. Use a good charging technique.
DO choose your cells wisely. Sponge/foam plates will not tolerate high

discharge currents as well as sintered plate.

Take care of your cells, and they will take care of you. I have
a set of cells from 1981 that are still working. Sintered plate,
450 mAh old technology -- rapid charged used a delta-V technique.

Contributing to the mythology of Ni-Cds,

Ken

p.s. NiMH cells can exhibit memory too, for much of the same
reasons as above....(substitute hydride for cadmium). You will
note less touting of memory-free operation of NiMH cells in the
the future as more experience is gained.

>Any suggestions?
>

I have not read the 73 magazine article, so I can't comment specifically
on it. However, in general, constant voltage charging of NiCad
batteries is dangerous, unless the current is limited to some
safe value.

NiCd batteries have a negative voltage coefficient with charge -- that
is, as the cell reaches full charge, the terminal voltage falls. This
is the principle behind the deltaV fast chargers. As the cell reaches
full charge, the temperature rises rapidly due to the internal oxygen
cycle. This reduces the potential of the positive plate and the terminal
voltage drops. If you are using a constant voltage (near zero impedance),
this means that as the cell reaches full charge, and warms up, the
cell voltage falls, and the current increases -- this leads to thermal
runaway, and a vented cell (lost capacity) or in the worst case, boom.

Anyhow, the magic voltage is 1.48V +/- 0.05,
which is the electrochemical potential of the cell when oxygen
evolution at the positive plate occurs. At
voltages above this, one needs to be careful of cell temperature.
(the magic voltage has a temperature coefficient that depends on
electrolyte and other factors, but should be accurate near 25C).
This is the maximum voltage one can charge a NiCd cell without
worrying about heating effects (i.e. oxygen evolution at the positive
electrode).

Unfortunately, the positive electrode doesn't reach full charge at this
voltage, and a considerable overvoltage is necessary to force the
positive plate into its highest oxidation state -- the number 1.63 sticks
in my mind. This of course, means that some degree of oxygen evolution
is necessary to reach a charge. Floating a cell at 1.63V will result
in disaster as it will overheat and vent. This is why constant current
charging is recommended. You automatically get a balance between
the oxygen cycle and cell temperature and cell voltage.

You mention pulse charging -- these are usually pseudo constant
current devices. The pulsed current is delta temperature driven.
Start with a high current, and as the cell warms, lower the peak
current. You control the circuit by looking at the open circuit
voltage during the off phase of the peak. Unfortunately, there is
no formula for the cutoff voltage, as the OCV during charge fractions
of a second after the charging pulse is removed is very dependent
on cell geometry (concentration and mixing effects). There is
a Eurpoean patent on this method: 0 311 460 (A2), Norvik Inc. 10.10.88

Good luck.

Ken

From kennish@kabuki.EECS.Berkeley.EDU Fri Jun 3 14:08:49 1994

From: "Ken A. Nishimura" <kennish@kabuki.EECS.Berkeley.EDU>
Subject: Re: NICAD CHARGING

I have seen several pulse charging techniques. I would imagine that
90% or more of their advantage comes not in the pulse technique but
in that they have good end of charge detection techniques. Heat is
the number one enemy of NiCd/NiMH cells. Overcharging heats the
cells badly. Heat degrades the separator, causes overpressure and
with enough gassing due to overcharge venting and loss of electrolyte.

I can see the argument for the trickle charge, though most all cells
that are engineered correctly should take overcharge in the "trickle"
range indefinitely. However, it is true that most trickle chargers
are about 10 times too much current. You really only need a C/100
current to combat self-discharge under the worst conditions. This
is about 7 mA for a AA cell. Most trickle chargers are 50 to 100 mA.
The rest goes as heat.

As far as dendrite formation, it is a self-feedback process. For some reason, an area develops where more deposited material forms. This makes the current density higher because of lower resistance due to smaller separation. Thus, more material forms and eventually the separator fails due to the repeated abrasion. Pulse charging has a small advantage in that the charging pulse is so fast that concentration effects help balance things out. I would imaging that it would help much more for a lead-acid where the electrolyte takes a direct part in the reaction. However, in the case of very high pulse currents, the rate of active material conversion can be limited due to the time it takes for fresh electrolyte to come into contact with the electrode.

Negative pulses may discharge preferentially on dendrites, but I haven't seen anything definitive...

I charge my cells with a constant current, and take great care to determine end of charge (delta V with delta T).

The compromise is to buy a board from Optoelectronics to allow the
RS-232. At last Ad, the OS535 was going for $199. That plus the cost
of a PRO-2042 is high, but the only computer interfaced unit that is
cheaper that I know of is the AR2700 which is now on sale for $209! AOR
is having a close-out on the unit!

I used to be a dispatcher for Highland Park PD, neighboring New
Brunswick. I have all the freqencies for that area at home, will
forward them to you tonight.

Off the top of my head...
New Brunswick PD 460.300 Channel 1
New Brunswick PD-2 460.225 Channel 2
New Brunswick EMS 155.220 (Med Central, area Medics as well as NB EMS)
New Brunswick Fire 154.385 (I think... will check this later)

Rutgers PD 155.685
Rutgers Fire/EMS 155.820

Highland Park PD/EMS 460.425
Highland Park Fire 33.82

Hope this helps

: Yes you are right, most wireless mikes work on these channels. BUT
: many television and radio stations are also licensed for remote
: broadcast frequencies which they use for transmitting audio or
: audio/video back to the studio.

: I have seen serveral who used these channels in their wireless mikes.

: Check the remote broadcast channels.

: J.W. Wolfington

J.W,

Hmmmm... Can you define what frequencies comprise the remote broadcast
channels? We aren't talking about the same range as Broadcast TV, are we?
From what you said, it sounds like they may operate in the business band in UHF
like approx 450-470mhz. I guess checking percon or grove cd's with the
name of the company that owns the radio station might produce something.

Thanks for your response.
Keith

> I just picked up a BC 20/20 at a thrift store....
> What's that "Position A/B" slide switch on the front for?

The 40 channel BC20/20 is an improvement on the 20 channel BC220.

The A/B switch was new to BC20/20. It selects between two
sets of 20 channels -- hence the model nomenclature "20/20".
The channels in both sets are labeled the same, 1 through 20.
Each channel set is further divided into two banks.

Internally, the feature board is quite different. The older BC220
used a 1024 x 1 serial RAM memory chip and a special "COPS" memory
controller chip. There were 2 custom CPU-type chips, too.

The BC20/20 used a single CPU and the memory IC had 8 address
and 8 data leads. One of the address leads (A7) is connected to
the A/B memory bank switch you want to eliminate.

While I don't have a ready-made modification to eliminate
the switch, I envision the output of a simple flip flop connected
to RAM pin A7 and triggered by a yet-to-be determined signal.

Here's my idea for a bonus modification to double the number of
channels from 40 to 80: Electra squandered 1/2 the capacity
of the RAM by connecting 4 pairs of data leads together. Just break
the 4 connections and bank switch the bus between the 4 pairs of
data leads instead (e.g., 4 pole, double throw switch).

> How does the scanner know whether to use the AM or FM detector?
> Is it based on just the frequency range that's programmed?

Mode selection is automatically determined by an internal CPU
based on frequency.

South Star is dispatched by Glouchester (sp?) county, NJ. Not too sure of the freq'. Since South Star is run by NJSP, they also talk to SPHQ on 800 Mhz. Also, if you hear where they are going, you can usually tune into the fire freq. of the town they are entering. They like to have an engine on standby (at least in Salem County). They can be hear here on 33.86 F (disp) 33.84 F (working) 33.88 F (really working) or 155.295 (EMS 1).

Not too sure about North Star.

Good luck.

It sounds like you are saying that to attack YOU is
to attack the hobby of scanning. Phew, what an ego!
I guess what your attackers have been saying about
you is correct. From what i've heard, the position
of fido moderator has a habit of driving people to
become egomaniacal dictators. That kind of attitude
however is NOT very well suited for the Internet.

>Neither am I freely open to attacks on my choice of posts.

In other words, we can expect more of the same... and the
rest of us can only savor the distant memories from before
the scanner groups became a subset of alt.flame.

END DEAN ADAMS DOUBLE-POST
==========

Your lack of candor is self-evident. I do not understand where you
get off sniveling that I attacked YOU. Geezus, fella, what the hell
do you call the above? A sex proposition instead of an attack?

(If so, I think I will turn celibate.)

>In any case, no matter how much you may wish to the contrary,
>I will NOT become one of your regular "playmates" in this
>pointless (and seemingly endless) flame war of yours.

Suit yourself, Adams. I just don't understand how you can expect to
move FIRST and LAST. You come from a very strange tribe of people.
Any so-called flame war cannot possibly continue if you don't START
it. You have been and still are...free. You made choices as proved
above.

If you feel I did something to you, then PROVE it. Show the facts,
Adams, and stop that damn sniveling. Talk scanners or talk sense.

I tend to agree with your evaluation of the scanner hobby. There is, however one thing not mentioned. The price of scanners are climbing out of sight! At a time when a lot of us are retireing on a fixed income. In my case, I looked ahead and made major purchases before I retired. The problem with this is that technology advances, and my equipment does not! :-{
The junk of today is yesterday's state of the art.

498. Battery Recharging Basics

Newsgroup: rec.radio.scanner
Date: 1996-08-05 00:00:00 UTC
From: ronkatz@interlog.com
Message-ID: <320625a6.27822004@news.interlog.com>
Source record: 227526

I've been reading some of the posts about Nicad Basics
and I thought I may be able to clear up a few points.

One person asked about Heat....

A Chemical reaction happens when you charge a battery.
During this chemical reaction heat is produced. It takes
energy to produce this heat and because of it, some energy
is lost during charging.

A battery is not a perfect storage device, because it
has resistance. (Capacitors have much less resistance
and loose less energy when charging but do not hold
much charge) Remember you do not get everything you
put into the rechargeable battery. You lose some energy
as heat also because of its internal resistance.

A battery is an electrical storage device that
produces electricity from a chemical reaction. In
order to pass current through the battery and cause
this chemical reaction that makes the battery charge,
you must over come its internal resistance. This is
done by increasing the applied voltage. Remember
that one of the reasons that heat is generated is
because of the internal resistance? This is why a
battery becomes warm when charging. Increasing the
applied voltage or lowering the battery internal
resistance causes more current flow. As a result
more heat is also generated.

To charge a battery, current should be maintained
at a certain level in order for the chemical reaction
to take place. You can not control the internal
resistance of the battery, but you can control the
applied voltage to the battery which will change the
current. Again, you can lower the current by lowering
the voltage or the opposite to increase the current.
It is this voltage control that helps to makes up a good
charging system.

For Nicad batteries it has been found that 1/10 of the
current capacity of the battery for a period of about
12-14 hours is around the correct charge rate for efficient
charging. (this chemical reaction to occur with minimal
loss of heat) Any faster and it does not become efficient
any more. Also note that heat also speeds up chemical

reactions. This makes charging more difficult because
of this changing characteristics of the battery during
charging.

Higher capacity batteries often have a lower internal
resistance. When charging with lets say a low power
charger what happens is you exceed the current capabilities
of the charger, damaging it. You will often notice
your charger getting too hot if this is the case. Parts
in your charger were designed to dissipate a certain
amount of heat but when you exceed the chargers capabilities
you destroy it from excessive heat and from the increased
current. Just like the opposite if you exceed the limits
of your batteries while charging.

By the way sealed lead acid batteries I found
are a much better choice. Think of when the battery
becomes charged and the voltage increases. The internal
resistance also increases this causes the current to
decrease as the battery becomes charged. As the lead
acid battery becomes charged it sort of regulates the
current because its internal resistance keeps increasing
when it becomes fully charged stopping it from accepting
any further charge. Only draw backs is that lead acid
is heavy and lead is unsafe for the environment.

For Nicads they will also increase in internal
resistance but as they become charged close to the
end of the charging cycle something happens. The
internal resistance drops causing an increase in
current charging the battery This causes heat,faster reactions,
over charging, finally destroying the battery if not stopped.

Nicad Smart chargers sense the drop in battery
internal resistance and shut off at this point. This
is how the charger knows a nicad is charged.

Many basic chargers do not sense this. This is
why time limits are set as to how long the battery
should be left on charge. They also assume that the
battery is fully drained before charging.

You can charge batteries faster but not as
efficiently. More energy is lost to heat. What do
I care you ask? Well, your not fully charging the
battery and your shortening the life of it by excessive
heat and in many cases your boiling it....That's how
I see it.

Just my 5 cents worth.

>So the prognosis is not good.

And new technologies such as trunking and digital systems hurt the
scanner radio market too. I know if I were new to scanning and my
local PD installed a trunked system, I would be dissapointed.

There should be more concentration in the scanner publications on how
to monitor these systems. Monitoring Times just featured an article
about this. In addition, scanner manufacturers should be actively
developing radios to better deal with the new technologies. They
should LISTEN to what the consumers want..not what they think would
SELL the best.

And finally most public service agencies I dealt with are not willing
to share any information re: trunking or digital (such as
fleet/subfleet assignments and talkgroup listings). They consider the
radio system (purchased with taxpayer dollars to protect you and I)
confidential. I believe that if you review the talkgroup listings, you
can better understand the system and it users.

Sorry I was on my soapbox but I believe for the scanner industry to
survive, the manufactures HAVE to deliver what the consumers want.

First of all, TV antennas are easily mounted in the vertical plane.

Secondly, the design bands of TV antennas are at least the following:

54 - 88 MHz
88 - 108 MHz
174 - 216 MHz
470 - 890 MHz

That alone makes them eminently suited for scanning. But then there are subresonances and harmonic resonances that provide good overlap into adjacent bands. Given the low cost, often FREE, and the simplicity of installation and maintenance, TV antennas are NOT a bad choice for the serious scannist.

The directivity, gain, and F/B ratio offer great advantages over discones and other omni antennas. Small size, light weight, low cost, and ease of installation make TV antennas extremely competitive with log periodics and superior to yagis except for specific objectives.

While log-periodics may well be functional and even better in some instances, their high cost, larger size, and more complex installation are monkey-wrenches sufficient to render them ONLY an option or alternative to other antennas.

Yagi-uda antennas also have great advantages, but corresponding disadvantages of narrow bandwidth and....cost/complexity. Yagi antennas are, like all others, an option or alternative. Not a panacea.

There is nothing at all negative or inferior about using a TV antenna for wide-spectrum scanning, and in fact, they work very, very well. Given the low cost and ease of installation, along with RG-6 coax and a cheap matching balun, a TV antenna may well be the ONLY choice for many discerning scannists.

One would not want to TRANSMIT from a TV antenna with this simplistic option, but given a handmade balun, even that can be done to great advantage. Most scannists would not transmit, however, and few would know how to wind a balun.

So for all practical purposes, TV antennas are best confined to the realm of scanners and scanning and not amateur radio, as of course is quite conducive with yagi and log periodics.

Dave,

Your antenna is a VERY critical link to good reception!

Use the TV Antenna for TV reception. It's design is for the TV
spectrum since the antenna is cut for the frequencies allocated for
TV. In addition, the polarity is horizontal for TV but vertical for
2-way radio (scanner). That is why the scanner beam performs better.

If you really want to increase your reception of DISTANT signals, try
the following:

Use only the best COAX (I use Belden 9913). Try to keep the length as
short as you can.

Get the antenna up as high as you can. Above the trees/buldings if
possible.

Use a good antenna. A yagi on a rotor will give the best directional
performance (gain). I have 3 - 155 Mhz, 507 Mhz, and 800 Mhz.
You can buy yagis at you local Commercial 2-Way radio shop.

Another alternative is to use a Log Periodic (whch is wide band) on a
rotor. Still good gain and spans 105-1200 Mhz. Create makes an
excellent LP! These Create Log periodic antennas are available at Ham
Radio dealers/mail order.

The directional antennas will provide much more gain than an
omni-directional discone or ground plane. The ground plane will
perform better than the discone for it's specified frequeny range
while the discone works over a very-wide frequency span.

Yup!

Rule #1 - Do not use the delay channel.

> At any rate, my main question is, is there any rhyme or reason
>to how frequencies are assigned or switched? Also, any tips on how to
>keep up with the changes?

Depends on the type of system, but generally no. If you could email me to tell me what service(s) you are monitoring that in trunked, I may be able to help. I know of several public service trunked systems in the area. NJSP Troop C (Motorola) and South Brunswick Township(GE/Ericsson).

If you are interested in NJSP, it seems to have an order to it (with some exceptions), but it is NOT the frequency-decending order that some publications publish. Again, I may be able to help here. I can also email you the Fleet/Subfleet assignments that I logged which may come in handy to understand ALL the users on the system. And how it can be almost impossible to monitor with a conventional scanner...especially during the day.

If you want to monitor GE/Ericsson..go out and buy a trunking tone eliminator board for you scanner.

I answered this post via a lengthy e-mail. The upshot is that this guy doesn't have the vaguest idea of what he's talking about. Anyone who wants to talk about computer security and crime and the applicable laws, instead of scanning, can contact me by e-mail.

'OBO' means "or best offer" and last I heard you could get a new bc
200xlt for $200. the cellular modification is no big deal, if you know
how to use wire clippers all you have to do is cut a certain resistor.

The putative violation is sort of a cyber anti grafitti violation.
More of a theft of service combined with a breach of the peace.
I believe that there are a couple of actions proceeding in some
local jurisdictions. One settled in Southern Calif. by community
service and a fine. No federal proceedings, as yet. But, a
couple of AAG's are lusting for just the right cyber case. Lots and
lots of college and university level disciplinary actions.

It is childish and it is wrong since it uses resources, the providers
and the recepient, that you do not have permission to abuse.You
have implied consent to use the facilities for mail, not for mail
bombs. What's so hard to understand here? Check your guns
with the sheriff, this is not some >>every man for himself<<
wilderness. Read the news.admin.net-abuse.misc group and put
away a couple of bucks to buy a clue.

Go to http://gate.cruzio.com/~mendosa/scan0794.html

Rick Mendosa and Shawn Miner updated the frequency list
for SLO, SB and Ventura counties in 1994 and they cover a
lot of what you are looking for. Also, Rick has moved to Santa
Cruz and has put up a page for that area as well. There should be
a pointer on the above.

519. Battery Recharging Basics

Newsgroup: rec.radio.scanner
Date: 1996-08-05 00:00:00 UTC
From: ronkatz@interlog.com
Message-ID: <32052a86.15716568@news.interlog.com>
Source record: 227585

I've been reading some of the posts about Nicad Basics
and I thought I may be able to clear up a few points.

One person asked about Heat....

A Chemical reaction happens when you charge a battery.
During this chemical reaction heat is produced. It takes
energy to produce this heat and because of it, some energy
is lost during charging.

A battery is not a perfect storage device, because it
has resistance. (Capacitors have much less resistance
and loose less energy when charging but do not hold
much charge) Remember you do not get everything you
put into the rechargeable battery. You lose some energy
as heat also because of its internal resistance.

A battery is an electrical storage device that
produces electricity from a chemical reaction. In
order to pass current through the battery and cause
this chemical reaction that makes the battery charge,
you must over come its internal resistance. This is
done by increasing the applied voltage. Remember
that one of the reasons that heat is generated is
because of the internal resistance? This is why a
battery becomes warm when charging. Increasing the
applied voltage or lowering the battery internal
resistance causes more current flow. As a result
more heat is also generated.

To charge a battery, current should be maintained
at a certain level in order for the chemical reaction
to take place. You can not control the internal
resistance of the battery, but you can control the
applied voltage to the battery which will change the
current. Again, you can lower the current by lowering
the voltage or the opposite to increase the current.
It is this voltage control that helps to makes up a good
charging system.

For Nicad batteries it has been found that 1/10 of the
current capacity of the battery for a period of about
12-14 hours is around the correct charge rate for efficient
charging. (this chemical reaction to occur with minimal
loss of heat) Any faster and it does not become efficient
any more. Also note that heat also speeds up chemical

reactions. This makes charging more difficult because
of this changing characteristics of the battery during
charging.

Higher capacity batteries often have a lower internal
resistance. When charging with lets say a low power
charger what happens is you exceed the current capabilities
of the charger, damaging it. You will often notice
your charger getting too hot if this is the case. Parts
in your charger were designed to dissipate a certain
amount of heat but when you exceed the chargers capabilities
you destroy it from excessive heat and from the increased
current. Just like the opposite if you exceed the limits
of your batteries while charging.

By the way sealed lead acid batteries I found
are a much better choice. Think of when the battery
becomes charged and the voltage increases. The internal
resistance also increases this causes the current to
decrease as the battery becomes charged. As the lead
acid battery becomes charged it sort of regulates the
current because its internal resistance keeps increasing
when it becomes fully charged stopping it from accepting
any further charge. Only draw backs is that lead acid
is heavy and lead is unsafe for the environment.

For Nicads they will also increase in internal
resistance but as they become charged close to the
end of the charging cycle something happens. The
internal resistance drops causing an increase in
current charging the battery This causes heat,faster reactions,
over charging, finally destroying the battery if not stopped.

Nicad Smart chargers sense the drop in battery
internal resistance and shut off at this point. This
is how the charger knows a nicad is charged.

Many basic chargers do not sense this. This is
why time limits are set as to how long the battery
should be left on charge. They also assume that the
battery is fully drained before charging.

You can charge batteries faster but not as
efficiently. More energy is lost to heat. What do
I care you ask? Well, your not fully charging the
battery and your shortening the life of it by excessive
heat and in many cases your boiling it....That's how
I see it.

Just my 5 cents worth.

Cross-posted to: alt.radio.scanner,rec.radio.scanner

The instructions for this mod are, to say the least, extremely vague. Can anyone clarify these two steps:

1. locate the 3 chip resistors at chips upper right..marked 104 and carefully desolder.

2. install the chip resistor at the 2 empty pads closest to memory battery.

Now, taking these two sequential steps into consideration, I'm led to believe that I am supposed to desolder all three chip resistors (104), but only resolder one. Is this assumption correct?

Also, there are several "empty pads close to the memory battery." This alone is really not specific enough. Could someone give a more detailed description (a diagram of some sort, favorably) of where these are located?

Any help would be appreciated. Thanks..

A major group of radio hobbyists that has refused to
respond to some changes in technology are amateur (ham)
operators. How may ham trunked systems have you seen?
There have been letters and articles in QST and other
publications about the benefits of trunking, especially on
overutilized bands in heavily populated areas.

Technological advancement used to come from the ham radio
ranks (and a little of it still does), but in some areas the
ham community is way behind the curve. If hams wanted
transceivers with trunking capability, the technology would
begin to deploy into the consumer market. After producing
trunking transceivers for the hams, how expensive would it
still be for Uniden, Kenwood, Icom et al to produce
trunk-following receivers for other users?

Excuse me, but is English your native language? If not, I'll bite my tongue. But if it is, whooooooooooey, fella....back to school for you.

>>THAT, my dear nescient fellow is not necessarily true. Go back to
>>your Kindergarten Physics book and look up "restricted orifice" for
>>starters..

>You know, there is some thing you can take for that...

See, Katz, you think I am slamming you when I bestow profound learning in that skull of yours that carries a "Space for Rent" sign. Pencil and paper time, Katz:

A restricted orifice is any opening of a finite cross-sectional area through which flows a fluid, forced by a pressure, which if increased, does not result in additional flow. Restricted orifices are generally limited to pinholes for practical applications. There are no passive equivalents of the restricted orifice in electronics, since any increase of voltage across a resistor of any size, will proportionally increase the current flow.

There are active equivlents in electronics, like an overdriven amplifier where the collector current cannot increase no matter the increase in drive signal. Silicon diodes are a voltage equivalent where the forward bias does not increase beyond the junction drop, despite massive changes of current flow.

>You are not the only one who has a formal education in electronics
>Billy. I too have studied Radio Electronics in College,

I didn't study "radio electronics" in college, Katz. It was electrical and telecommunications engineering. "Radio electronics" is taught in ham novice classes, maybe some AAs junior colleges; definitely some high schools, ... oh, and by CIE, Grantham, and NRI correspondence courses.

> I have studied a lot of different things

I can well imagine you have.....but not English and not electronics.

> and Yes I am also a News Videographer.

Why aren't you working in electronics, Katz? Pay is better.
Opportunity is better. You must be a News Videographer because you
failed BE&E and dropped out of college.

> I keep learning new thing Billy.

When I get done with you, you will have learned new thingS, lots of
'em.

> Just because you
>stopped at CBs and 3 Radio Shack scanners does not make you any
>better. There is a hole new world out here Billy you really should
>get away from your computer once in a while.

Did you study English any? You are one very deficient fellow.

>>>You know best..

>>Yes, Katz, in this field....I do.

>If YOU say so. If you think it will help sell more books then sure,
>I'll agree with you.

I'd prefer you keep showing your butt and not agree with me. We'll
extact more of your true colors that way.

>>Katz. Hey Katz! (I design UPS and battery-backed systems. Some as
>>big as a room.)

>Wow, good for you Billy!! I only design Battery belts for video
>lights.

Because the news station can't afford an engineer..... and
besides, design one, and you've designed 'em all.

>I'm interested to know, Is your UPS just a battery and charger or does
>it output AC?

It puts out RF pulses, DC waves, and tunes of "Oh Canada!"

>>You are one dumb doode, Katz. Very, very, dumb. The voltage does not
>>stay the same. Apply 13.8v to a battery resting at 11.0v. Initially
>>current will be high, but as the battery charges up, 11.1, 11.2, 11.3,
>>etc, the decreasing differential between charger and battery results
>>in a down-ramp current function....regardless of the fact that the
>>battery's internal resistance drops (at a slope less dramatic than the
>>slope of the voltage increase). The voltage slope is dominant, Katz.
>>Now quit being stupid.

>Yes if you are using a regulated power supply the applied voltage WILL
>stay the same.

What are you talking about? That's utter imbecilic idiocy. Is this
what they taught you in "radio electronics"? Oh shit! I'm getting
out of here.....YOU are dumb and dangerous, Katz. You're going to
blow something up.

Look stupid:

13.8v 12.6v
Reg Power Supply (+) <---------------------------->(+) Battery
Reg Power Supply (-) <---------------------------->(-) Battery

In the above system, you're saying that the applied voltage (13.8v)
will "stay the same". It won't. <giggle>

>>>What school did you come from? Did you say in one of your posts that
>>>you are an Engineer. Is that an Electrical Engineer? You don't do
>>>house wiring do you? Seen any good fires lately?

>>Several very, very good schools, Katz. Yes, EE. (And FCC 1st Class
>>Radiotelephone License with Radar Endorsement. Member of IEEE, ISA,
>>APCO, NARTE, RCA, and MENSA. And yes, I have two wires for you; one
>>to stick in your mouth and one for your.......never mind.

>Very good Billy, did they have semiconductors when you were in school?
>I understand your in your sixties.

Wrong. Just turned 50. And I cut my teeth on vacuum tubes. But the
emergence of solid state required retraining....and in fact, I am
ALWAYS in school of some sort or another. In this business, you don't
keep up, then you drop out.

>Nice list of licenses and Membership Billy.

Yes, it is, thank you.

> Did you study for your IEEE through one of those match book exams?

You don't study for the Institute of Electrical and Electronic
Engineers, Kitti Katz. If you ARE an engineer and qualify, you're
accepted. Likewise with NARTE, RCA, and ISA.

>What about the Radar Endorsement? Have you been getting too close to
>the gun diodes? You really should not point them at your head you
>know.

I have never in all my life ever heard of a "gun" diode. I will,
however, be pleased to give you an enema with a gunn diode, but better
still, a klystron or maybe a magnetron.

>No, you think that radio is only part of my news work, or that it is
>just a hobby Billy. But your wrong. Thats ok though, I know it makes
>you feel better.

Katz, you don't know the basics. How could you possibly be hired to
work with anything relative to radio?

>>And you want to degrade and call me wrong for what I've studied and
>>worked for over 30-years? Oh geezus....... but read on......

>Lets see, you must have been in school until you were 30

I'm STILL in school, you pompous ignoremus.

>It that don't difficult at your age?

Say what?

>My shovel is bigger then yours Billy,

The one you shovel shit with?

> When you decide to act your age and stop with the public flaming
> then maybe we can live in peace.

When you are ready to deal in truth, maybe. Not until then.

>Until then Billy, the internet is not my life.

You don't say?

> I have a life outside of radio,

Noooo! Really?

> I have friends

Who?

> and I work.

For a living? Ha ha ha ha

>I can leave tomorrow and you mean nothing to me. I can get a
>different ISP and use a different name if I want. No big deal Billy.
>This is not my life.

Really? Let's see.

>> There was no call for you to come on to me like you did.
>>Now it's my turn. :-)

>Have fun... I can turn off my computer and your gone. You on the
>other hand most likely loose sleep over this. <grin>

<giggle> You -=won't=- turn off your computer, though, and I won't be
gone, and I do sleep very nicely, thank you.

>Remember the TRUCE you were asking for?

Not from you, Katzenjammer. We have us some business to settle first,
you and me. Some truth telling to do. Some facts, Katz, to dig up.
A knot to jerk in your neck. Your jowls to slap back and forth.

> Well its all up to you Billy.

I know. It's MY turn, remember?

>This is the end of this tread....

I'll bet..... :-))

It is used a lot here, but when we say it it confuses our dispatchers.
(Then again, when we say "Dispatch" it confuses our dispatchers.) How
about car vs. dog, patient trapped? No, it wasn't the dog.. don't ask me
how, 'cause I didn't see the scene, but the driver of the car was pinned..

> more spamming than ANYONE.

I guess that you did not receive my earlier question regarding the definition of spamming. So, I dusted off my web browser and went looking for myself. I had sort of assumed, based on the recent content of this group, that spamming was anything said that anyone else did not like or that it vaguely had something to do with posting to lots of different groups. I found the following:

==========
news.admin.net-abuse FAQ

<snip>

2.1) What is Spam?

It's a luncheon meat, kinda pink, comes in a can, made by Hormel. Most Americans intuitively, viscerally associate "Spam" with "no nutritive or aesthetic value." The luncheon meat has its own newsgroup, alt.spam.

The term "spam," as used on this newsgroup, means "the same article (or essentially the same article) posted an unacceptably high number of times to one or more newsgroups." CONTENT IS IRRELEVANT. 'SPAM' DOESN'T MEAN "ADS". IT DOESN'T MEAN "ABUSE". IT DOESN'T MEAN "POSTS WHOSE CONTENT I OBJECT TO". Spam is a funky name for a phenomenon that can be measured pretty objectively: did that post appear X times?

<snip>

==========

Note: The above is verbatim from the news.admin.net-abuse FAQ. The only change is CAPITALIZING what I considered to be the material pertinent to this discussion.

It goes on to say that while you may object to advertising on usenets, it is not against netiquette unless it of off-topic. I don't believe the any of the above definitions apply to Bill Cheek. His abusive language which he indicates is a reaction to that directed toward him is certainly no worse than yours and lately it seems that you have taken the lead in promoting this conflict.

I am neither for nor against Bill Cheek. I don't know him, I probably never will. I don't subscribe to the fidonet group that is mentioned frequently. I don't own, and probably never will, his publications or products. I am not that much of a scanner enthusiast. I use it as a tool, not a hobby. He has occasionally posted something of use to me in this group. Therefore, I have no complaints with his postings prior to the flame war.

Regardless of your reasons, this pointless feud between you, Bill Cheek, and the rest of the participants is an incredible waste of time. I will not speak for anyone else, but based on the response of posters that are outside of the feud, it seems obvious that this ego contest needs to end or move somewhere else. If the rest of your audience are like me, we are way past being impressed by your clever repartee' and the credibility factor of all of you is rapidly diminishing to non-existence.

Glenn Reed, KF5XB
CAP - OKWG/DCA

P.S. - I am not a glory hound or out to feed my ego. I have other avenues for that pursuit. I would have sent this as a private email, but for some reason, your address does not accept replies.

most rechargeable batery packs use the same size cells. I had a similar problem with a laptop batery and was able to use the batery cells from a remote controll car batery pack. the cells used in these batterys are about .9 inches in diameter and 1.7 inches long. they run about 1.2 volts each, and sould work as long as you have he right combined voltage.

Help..
I just put up a discone antenna about 40 feet up..fed it with coax
and the radios' performance seems to suffer when i connect the coax.

when i attach only the "center-pin" of the coax, the antenna seems to
work, but not well...any ideas?

thanks

bob.

From: Miguel Joquim Esteves Branco da Silva <mjebsilv@mail.telepac.pt>
Message-ID: <3207CBDC.4A65@mail.telepac.pt>
Source record: 227358

I'm a new radio scanning fan and I've been able to do an VHF antenna for Airband.

Everything is going well I manage to hear planes as long as 200 nm from home (when the weather cooperates).

For the last three months I've tryed to setup up an HF Dipole Antenna to be able to hear Oceanic HF Air Communications. I've done an simple dipole 1/4 wave lenght antenna (the frequencies are from 2MHz to 28MHz, the mid-value is 15MHz and the wave lenght is 19.9m so the elements are 5m each) but it's very dificult to here something.

I know that HF is not "Hi-Fi" but my radio (it's an AOR 1500 EX) sometimes allows me to hear something and because I now peolple that with a radio similar to mine have good HF reception conditions, I bielive that what is wrong is my technical knowledgment about this subject!

So is there any one that could help me to build a good antenna? Please I would like to learn about materials, conception, design and best instalation. I live in Lisbon and between me and the Airplanes flying on the Ocean it's only the sea! No moutians, no buildings! I bielive that this are the best situation...Isn't it?

I am gratefull in advanced to who is able to help me. Thank you.

Well, if the fixture is a table lamp, it's real tricky to install it into
PRO2006 (it will work, however).

Opto has a sale on the OS456 for around $200. Best price they've offered
(which I assume means they're blowing them out because the market is
drying up, so if you or anyone else thinking about adding computer control
to their 2006, now is probably a good time to decide one way of the
other).

Before people go ballistic over this, let's get the facts. Can someone find out what these rules actually say about amateur stations, if anything? What does "MAY" have to perform an RF environmental assesment mean? Does this apply to sporadic transmissions like ham stations, or only constant emissions like broadcast, cellular, relay towers, etc. Are frequencies taken into account in any way (certain parts of the VHF, UHF, and microwave spectrum have much greater potential for biological impact than HF or other frequencies. Is there a certain distance from an antenna to the nearest house, etc. that would exempt most of us? Also, don't all proposed new rules have to go through a comment process?

There already are "environmental impact" rules about antenna structures, and 99.9% of hams just check a "No" box on Form 610 and get on with their lives.

I'm sure the ARRL, not to mention many commercial organizations, would raise quite a squawk if every user of a 50+ watt transmitter in the U.S. had to file Love Canal-style paperwork. This would involve every police and fire department in the country, for starters.

BC>>Why? What happens if they aren't?

BC>Remember the legend of the "memory effect"? Well, THAT was disproved,
BC>but there was a reason for its persistent propagation. Exactly what
BC>it was, I don't remember, and don't have the time to research it in
BC>detail at the moment. Something about the internal chemistry being
BC>more active at a low state of charge than at higher states.

The way it was told to me, it was a definite change in the internal chemistry that prevented a full recharge. Again, according to electrochemists, _some_ types of Nickel Cadmium cells could somewhat restore the internal chemistry by discharging to zero volts and then recharging at a low rate, avoiding heating. This would not work on all such batteries, regardless of some of the urban myth propagated.

BC>I will try to look more into that for the sake of knowing, but for
BC>hobbyist applications where in-depth engineering is not at issue, the
BC>rule of thumb to keep your batteries fully charged is a good one.
BC>After all, you may not have time to charge them when an emergency
BC>occurs.

BC>>Lead-acid cells are damaged by storage in a discharged state.
BC>>I've seen no convincing electrochemical explanation for such an assertion
BC>>about NiCd cells.

BC>NASA Technical Journal.

For those who want to know more on recharging secondary cells, there's a lot of information available from Linear Technology Corporation and Maxim Integrated Products Corporation up in Silicon Valley. They have catalogs and application notes for their charger ICs. Linear emphasizes temperature sensing during charging. Full circuit details, too. Only problem is that one has to be in the electronics industry to receive the free info.

BC>>>To discharge a cell below 1.0v is to risk permanent damage to the
BC>>>cell.

BC>>Why? What happens if you do?

BC>Again, chemistry. Not to mention increased internal resistance of the
BC>cell. But I'll see if I can learn more about exactly what.

I've talked to a few electrochemists as part of my work and they rapidly get into the esoterica of electrochemistry beyond my ken. A secondary battery may be simple, but the chemical reactions inside are complicated. Suffice to say that KEEPING THEM CHARGED is more than a rule of thumb, it is sound advice from the few who are involved in _making_ them.

>considered regulations on RF emissions.

An EA filing would be required if a station is out of compliance with
the new exposure rules and wishes permission to operate anyway. Without
a complex, costly, and time consuming EA (and favorable FCC action,
frankly unlikely), an amateur station *must* be brought into compliance
with the new rules by Jan 1 1997.

This is likely to affect a considerable number of amateurs. I'd
suggest most amateurs running more than 50 watts who use an indoor
antenna are out of compliance. And those using low outdoor antennas
may have to install fences with access interlocks before being able
to crank the power back up over 50 watts.

OTOH, if your antenna is more than 10 meters above any horizontal
surface where a person might stand, and you're running no more
than 1,000 watts ERP (that's your output power minus feedline
loss and plus antenna gain), you're probably Ok. You'll need to

evaluate each situation, however, to be sure you are in compliance, this is only a very crude rule of thumb, and not sufficient to assure compliance (your MPE might still be too high in the above scenario depending on antenna type and orientation). The chart in Appendix B of the report and order gives the allowable limits for controlled and uncontolled exposures at various frequencies (exposure limits are different for different frequency ranges).

The controlled exposure numbers are the limits for *your* exposure. The uncontrolled exposure numbers (much lower) are the exposure limits for any member of the general public due to your transmissions. This latter number is likely to cause problems for those operating in apartments or condos. (The numbers are approximately 30 times lower than the previous ANSI limits the FCC has used in the past for licensees not exempted, IE broadcasters. Amateurs *were* exempted, but no more if they run 50 watts or more.)

If we follow the good amateur practices of mounting our antennas as high and in the clear as possible while running the minimum power necessary for communications, many of us will be Ok. The problems are going to arise for those using indoor antennas, low outdoor antennas in access uncontrolled areas, and for those with close neighbors or public throughfares. HF mobile operators are going to have to be particularly careful. Operating in a parking lot, or in heavy traffic, could easily put you out of compliance unless you drop your power to below 50 watts. There aren't many VHF+ mobile operators running more than 50 watts, so most of them will be exempt. Those who are running 50 watts or more, however, are going to have to take steps to limit exposures.

People running glass mount antennas are almost certainly out of compliance with even the controlled exposure limits, but remain exempted if they're running less than 50 watts. That's not a good reason to still be suffering excess exposures, however, and prudence would suggest getting rid of that glass mount and drilling that hole in the roof like I've been urging you to do for years.

Repeater owners may be in particular trouble if their site isn't controlled access (and even if it is if the *combined* exposure from all sources on the site exceed the controlled exposure limit). In the latter case, *everyone* will have to shut down any time maintenance at the site is to be performed (or suitable protective clothing will have to be worn by the maintenance personnel entering the area). This is a *biggie* folks, and may limit amateur access to many places where we've traditionally sited repeaters. The site owner is going to be held primarily responsible for seeing the exposure limits aren't exceeded, and they're going to turn a fish eye on amateurs trying to cadge a free site. (Get your "moon" suits now, it may be the only way you'll be allowed onto many sites.)

Note, we don't have to file an EA unless our station is out of compliance and we want to operate it anyway. But we *do* need to do the measurements or calculations showing that our station *is* in compliance with the exposure limits if we run more than 50 watts. This information must be kept with our station records, and be available for FCC inspection at any time.

Some of the limits are going to be hard to measure. For MPE, above 30 MHz there aren't any trustworthy instruments available. The FCC is going to allow us to measure the Volt/meter field and calculate the MPE from that. For well characterized antennas, the FCC will also let us depend on computer simulation calculations. For SAR limits, that's the only prudent way.

Hardware gurus need to be designing suitable instrumentation for us to make sure we're in compliance (and suitable field calibration techniques to assure us the instruments are trustworthy). Software gurus need to give us computer programs to model exposures. Both of these are going to be tough tasks if they're to work in the real world where our stations operate, and not in some idealized free space.

Remember, we have to have documentation on file with our station records showing that we are in compliance before we can run 50 watts or more. 49.99 watts may wind up being the new defacto amateur power limit if we can't come up with reliable hardware and software to document that we're in compliance with the new exposure limits.

> helo to base freqs other than 155.400 which they may have stopped using.

Pulled out my Mr. Scanner listing, and here's what I find relating to helicopyer:

155.220 Hospital Helicopyer Consortia
155.340 (same)
122.950 (same)

Grant has listings for 152.007, 155.175, 155.220, 155.280,155.400, & 157.450. No listings found for SkyMed. The 155.220-155.400 range is all the hospitals in the Columbus area (Grant, Riverside, etc..)

This book is also about a year old.. hope it helps

My guess is that the coax is shorted. You may want to inspect the
connectors at each end for a small piece of braid touching the center connector.
If you have an ohm meter or a continuity tester of some sort, disconnect both ends
and check for continuity between the center and the outside shield. It should be
infinite.
Good luck.

To my thinking the real, immediate problem is that IF the amatuer station has to file an EIS, that gives every neighbor and enviro-busybody an invitation to object, delay and appeal the "construction" of the station. Out here on The Left Coast, that practically guarantees a group of hystericals and allies from The Birkenstock Brigade adding their 2 cents worth to every station they decide is a "risk". Remember how ham radio got pilloried by KING-TV, Channel 5 when the neighbors set on sacrosanct magnolia Hill had problems. I can't wait for that old rag Jean Ennerson to find this issue to crusade on.

Yes, but those phones are designed to be used in an aircraft and are
correctly installed and verified as to not interfer with any navigational
radios.
What they're worried about is all the unknown and uncertain RF noise that
MAY or MAY NOT be emitted from different kinds of passenger radios.
So to be sure, it's easier to just say no to all passenger radios.

>I think the real reason why they do not want passengers using scanners

I don't think you're correct. Against your theory speaks the fact that
some airlines are providing ATC communications on one of the entertainment
channels on board. They even tell you which channel to select to listen in
on the communication.

> Could they be the new hazard warning systems. They use a band up near
> the bands that radar detector use.???

The two warning systems in use Here in UK are called Traffic Master
and Traffic Mate.

Traffic Master uses a graphical display to show the location of
motorway holdups and accidents. I believe the transmitters are
co-sited with cellular telephone transmitters.

The Traffic Mate system uses a small dash mounted receiver, similar
in appearance to a Radar detector, which produces a spoken warning
message. these operate in the 433 Mhz shared Amateur band at only a
few milliwatts power. The transmitters are grey boxes mounted on the
embankment near junctions and bridges, with two aerials mounted
above. One aerial is longer than the other and they appear to be
encased in lengths of grey plastic pipe.

I supect that one is the transmit aerial, and the other receives data
from the control centre, but I may be wrong.

Cheers,,,,Jack.

BC>Incorrect. Capacitors have extremely high resistance, better ones
BC>bordering on infinite. (Upwards of hundreds of megohms)

Bill:

You have probably put an ohmeter on a cap and saw the resistance
go to infinity. An ohmeter places a voltage on what it measures
and then measure the current. It uses ohms law to compute the
resistance. If the cap doesn't leak, it will appear to have infinite
impedance. This does not mean that the cap has high resistance, because
the resistance most people are concerned with is the ESR (equivalent
series resistance). A good cap (ceramics, OSCONS, etc) has low ESR.

BC>That means if you drain those cells at 233-mA for three hours, and
BC>then recharge them at the same rate for three hours, you'll be 75% or
BC>so of the way there. The C/3 rate is good good for maybe 4-6 hours as
BC>opposed to the C/10 rate at about 14-18 hours.

What does that last line mean? You make it sound like a battery charged
at c/10 will last 4 times longer that a battery charged at c/3.

BC>So long as you choose the same physical size and general type of
BC>batteries, there is no inherent risk to the scanner. In this case,
BC>we're talking "AA" cells in NiCd or NiMH type. The risk lies in
BC>prematurely damaging those new cells if the original recharger can't
BC>handle them. I don't know how the recharge circuit of the AR-8000
BC>is built, but it might could use a change of limiter resistor if you
BC>want to use the same recharger with a beefier set of cells. THAT was
BC>a major purpose of my article, you see.

I have a copy of the charger, though not with me at the moment. I think
the AR8K gets plenty hot already and would not increase the dissipation
any further. At best a charger with a dc-dc converter would be needed
so that the heat is limited to the batteries themselves. I once set the
AR8K on its back on a bed with the charger plugged in and it got very
hot. External charging is a better method.

BC>>2) I've seen a charger that claims to charge 700mAh in 3 hours. Is
BC>>this safe to use?

BC>Possibly. Provided that the cells are removed from the scanner and
BC>placed directly into the new charger. But I have trouble accepting
BC>that 3-hr claim. I mean, hey. you -=can=- recharge a set of NiCds in
BC>15-mins, if you want to. (Never mind that their service life will be
BC>decreased from years to days!)

I use two types of Sanyo offline chargers available at Frys Electronics.
I have a few sets of batteries and generally use the Sanyo 7hour charger
as a trickle charger. This charge only does AA and 9V and thus is very
cheap. [$10 with 2 nicad AAs included.] If you have a few spare batteries,
the need for quick charging diminishes. The other charger is a Sanyo 3 hour
charger which I use for charging C-cells. It cost around $30. My point
is this is a case where DIY doesn't buy you much. If you want to do a
1 hour charge using -dV termination, then DIY may be useful. Anything
more than 1 hour is a waste of time to build yourself.

You can go to model shops to get batteries capable of 15 minute charging.
The batteries look like fat AAs but are only 800mAh. I don't believe there
are AA that take 15 minute charges.

Regarding NMHi, beware of the high self-discharge rate. I know one person who claims he got only 150 cycles from a NMHi pack, but I have never done the experiment myself. Panasonic is supposed to be releasing 950mAh nicads. That is probably the way to go.

MS>get hot as the cell approaches zero voltage.

I suspect you will want to charge that dead cell. If you dump a lot
of current into it while the cell voltage is low, it will get hot
due to the higher series resistance. Most fast chargers trickle the cells
to 1v before fast charging to avoid this.

I can recommend the Motron TDD-8X DTMF Display Decoder Board. It is the least expensive stand alone decoder/display I have found, and it works really well.

It comes as a pre-tested circuit board... just add DC power and audio from your scanner, phone line, or DTMF pad (no phone interface, just an audio input jack). It has 8 1/2 inch high red LED displays that shows the last 8 digits, with scroll buttons to view a total of 104 characters that it saves. This costs $59

A mounting kit (kind of a poor man's case to protect the board) is $15.00. It also comes with Software and a data port to connect to a computer so you can continually log dialed DTMF strings to a file or spit them out to a printer as they are being dialled, along with the datre and time of capture.

You can call for info or place an order at 1-800-338-9058.

No, I have no connection with them, I just like their product!

Hello,
I make and sell a DTMF decoder that you might be interested in. It has a 16x2 line LCD display, has 511 number non-volatile memory, RS232 output, a cable to attach the RS232 port to your PC, up/down scroll buttons and is powered by a 9 volt battery. Tone's identity are sent out the RS232 port as they are decoded, and/or you can dump the memory contents to the RS232 port at the push of a button. Pauses greater than 5 seconds cause a delimiter character to be inserted on the display. You add a case.
Audio can be made via pigtails to your scanner's audio jack or speaker.

Power can be supplied via the 9 volt battery snap, or any DC voltage ranging from 5.2V to 40V. Current draw is only 10 mA. Price is $65.00 plus $5.00 shipping (plus tax if you are in CA). All my products come with a 30 day trial period and a 90 day warranty.

Also available is a DTMF decoder, same features as above (less the display) for $40.00. This version is for you if you only wish to log tones into memory for later dumping to the RS232 port, or for logging to the RS232 port during tone acquisition.
For more information, and a picture of the entire thing, point your web browser to
http://www.rain.org/~dschmidt

The drop in terminal voltage when a nicad is nearly discharged
does not necessarily mean that the cell's internal resistance is
increasing. Most nicads have a fairly "flat" voltage curve with respect
to time when you put a constant current load on them. It's nearly flat
right up to the point where the cell is 100% discharged and then the
voltage drops like a rock.

Nicads would not heat up any more near the point where they were
almost discharged than they would when they were fully charged because the
internal resistance doesn't change that much.

YOUR rules. Ones YOU adopted. Ones YOU enforce.

>>All the man said was that appeared that lot's of us here are
>>fed up with you. And that you were being kicked rather hard here.
>
>What does that have to with scanners and scanning?

Nothing. What it does have to do with is calling to question the
adopter and enforcer of the rules. It seems to me as I remember the
Fido philosophy, it was imperative that the users of a particular echo
had the right to do this. Otherwise an echo in question became the
personal property of the moderator. I was involved in some discussion
of such matters several years ago when the national Fidonet convention
was held in Northern Kentucky. It's been about five years since I was
a sysop so maybe things have changed. I doubt it.

>If you are a former SysOp, then surely you remember echo rules? And
>HOW they are enforced?

See above. I don't know what the CURRENT rules are. I do know what
they WERE.

From: No_address@no_where.org
Message-ID: <32068B8F.18E9@no_where.org>
Source record: 227438

Well Bill how are you doing?

This has gone on for over 2 weeks now I guess.

I feel that you have been appropriately dealt with, & I think
others do also.

You have shown yourself to be a liar when you said I did not have
valid PO Box to mail to so I posted the image of the postcard you sent
& you said you would give Mr. Kaose a warning actually you did kick
him off your echo.

Your conduct on this echo has been brought to the surface for
people to judge on their own. You have heard their opinions,
which are mixed.

At this time I am willing to bury the hatchet with out further
issue provided you are willing to do the same.

It is your choice.

By now you know I have more than enough resources to keep this
up for an indefinate amount of time. But honestly, I would rather
let these threads die for the good of all & hope you would see it
this way also. Perhaps we may never agree on anything else, but I
hope we can agree on ending this.

Should you decide not to "bury the hatchet" then I will use my
resouces & continue as I have to date. You know the many
things that have happened & I don't need to go into specifics.

What I am suggesting is a live & let live policy between us.
Fundamentally, I do respect your knowledge of scanners & for that
reason I NEVER attacked you on that topic. Mainly, your attitude
& actions are my objection. That is likely something we will not
agree on.

As I said above, "it is your choice". We can either stop or
continue, I am prepared for either. As indicated by the users
of this group, they would rather it stop.

The decision of wether this stops or continues is yours.

>The following, from my archives, might be of interest:

Definitely interesting. I didn't recognize any of the names but they seemed to know what they were talking about. The chemistry was a little much for me to assimilate at one sitting, but what I read seemed to agree with what I researched years ago.

The one dude stated a case for the "memory effect", though he went on to qualify it as "rare", if I recall correctly. His analysis may or may not have agreed with the studies performed by Gates and General Electric, but they reported NO EVIDENCE of this phenomenon. So maybe there were issues of semantics or perhaps these fellows discovered something since the Gates/GE studies. (Entirely possible, since the Gates/GE studies are at least 10-12 years old now.)

In any case, that was a super nice post, but a hell of a wad of material for the casual hobbyist to filter and swallow. THAT is precisely why I periodically translate volumes of gibberish like that to a layman's level where the "rules" are pertinent, but not complex. And when I have to err in the explanation, I prefer to err on the conservative side.

In a word, it is better to end up with 90% charged cells than 110%. No?

How right you aree, too! Trunked systems can take a lot of the fun
out of scanning.

> In addition, scanner manufacturers should be actively
>developing radios to better deal with the new technologies. They
>should LISTEN to what the consumers want..not what they think would
>SELL the best.

There is a problem. It is illegal, or shady at best, to market a
trunked system follower. You see, each trunked system is controlled
by proprietary (and copyrighted) software. You'd have to pirate the
code to have any success. But no reputable manufacturer would take
that risk.

I don't think we will be seeing any trunked follower scanners for that
very reason, Joe.

THANKS for telling it that way, Clint! That's exactly how I feel
about it. If there were nothing of meaning in what the snotballs say,
then hell yes, I could feel good about ignoring 'em. Like I ignore
that Mackey dude most of the time. It's easy to ignore the ignorant.
He attacks ME, which I can handle with a grain of salt all day long.
Hell, I know ME.

But for those who attack my education, profession, art, science, and
technology, well hell..... they can put up or shut up. And I aim to
return their challenges until they do.

Do-goody people like to preach how much easier it is to catch flies
with honey than vinegar.

But you know what? I can catch me more flies with *shit* than with
honey and vinegar put together!

<Giggle>

And I'm catching me some, too! Got a whole jarful!

Thanks again for that unique viewpoint. It carries a lot of meaning
in my particular case.....which is a lot different from most. So
much different that most folks can't see it, and I quit trying to tell
'em.

Crystal scanners have ALWAYS been more sensitive than the synthesized radios and at the same time have hardly had any intermod problem AT ALL.

If crystals were still readily available (I mean EASILY readily available) I never would have gotten rid of my old Regency! I had a Bearcat Four-Six that was a GREAT radio until I, uh, ran over it with my car. Don't ASK!!!!!!!!!!

Yeah, the programmables are certainly more flexible, but they definitely don't HEAR better than the old crystal radios.

>You are correct here I made a mistake. Good one Bill. Your listening
>for a change.

No, Kitti Katz, I am....*telling* you.......

>>A 1-farad capacitor can hold enough charge to spin your eyeballs like
>>a slot machine.

>Yes that's correct but for a very short period of time.

That quite all depends, wouldn't you say? The discharge time of a
capacitor is approximated by five time constants where one time
constant equals R*C, where R is series resistance in ohms and C is in
Farads. A 1-F cap taakes 58 days to discharge through a megohm
resistor.

> Compare it to a battery of equal size, let say, or even
> one much larger one and it will still not have the reserve

> like a battery will.

Yo, Kitti! Capactors are to batteries as jugs are to spigots.

>A capacitor stores electricity. It does not produce it.

No shit, Sherlock? Trouble is, batteries store energy, too. They do not "produce" it. There is no conversion of energy in a capacitor like there is in a battery where chemical energy is converted to electrical.

>>Capacitors do not lose energy except by two means: discharge through
>>a resistive path,

>Some applied load, yes....

Beg your pardon? Use English please......

>Air is also a resistive path...

Not when it isn't ionized.

>good your understanding I see. But where you failed is that
>we just said the same thing. Or at least your trying to say the same
>thing.

Oh no, Kitti, I am tell you like it is. You are spewing sheer nescience and utter obfuscation.

>>The correct explanation of a recharge process is that the
>>electromotive force of the battery must be "overcome" by a counter
>>electromotive force.

>Don't confuse people here Bill, you don't have to impress anyone. You
>can use the word Voltage not everyone knows what EMF is.

I will use voltage when appropriate, and EMF when it is appropriate.

>In other words your overcoming its resistance. Same thing here Bill.

No, Katzenjammer, it is NOT the same thing, and not even close. Electrical resistance is NOT a force.....not by the remotest stretch of the imagination. Therefore, there is nothing in resistance to "overcome". Only a force can be overcome.

Furthermore, no amount of finite resistance can stop electron flow.

However, one billionth of a volt can totally stop current flow that would result from one billionth of a volt of the opposite polarity.

That's why I chose my terms very carefully, Katzenjammer....let's repeat it one more time: ELECTROMOTIVE FORCE. Now let's state the applicable principle one more time: In order to charge a battery, an electromotive force must be applied to it that is greater than the EMF exerted by the battery.

You are confused by the term, "resistance", as used by arm wrestlers against each other. THAT kind of resistance is a force. And the greater force will overcome the other. Electrical resistance has nothing to do with energy. But FORCE *is* energy.

>Its like trying to move a car. You can like I said, push harder and
>the car will move.(voltage) Or the way your saying it, let your
>foot off the brake a bit and it will also move. (resistance)

No it is not like trying to move a car. Not like you are saying. There are EXACTLY TWO parameters involved in the moving of a car:

MASS and FRICTION. Either one can be awesome, but mass is not energy. Friction is. It is ONLY the friction that has to be overcome. Let's go back to Kindergarten Physics:

F = MA and E = IR

Note the similarities. Force (F) and Voltage (E) are synonymous. Mass (M) and Resistance (R) are equitable. Acceleration (A) and Current (I) are related.

So when you go to move that car, only friction is overcome. The rate of change of velocity is dependent on mass, but "rate" has nothing to do with "overcoming". You see, 1-gram per acre of force can move a billion tons of mass. Any force at all will move a mass in a friction free environment. When friction is involved, then the force has to exceed the friction or the sucker won't move.

Ditto with electromotive forces versus resistance. Write that down Katzenjammer, and take it to the bank.

>> Resistance is NOT a part of that equation,
>>except for the RATE of the recharge.

>WRONG. It is part of the equation.

Boy, are you ever stupid, then.....

>I'll try and put this in a way you can understand Bill.
> Bill what you fail to understand is what resistance is.

Izzat so? You don't say..... So what are you drinking tonight?

> Resistance can be in the form as an opposite charge.

That statement goes beyond the realm of stupidity. There's something the matter with you. You done let a brain fart, Katzenjammer.

>Its like the car pushing back it you when someone presses the gas
> pedal as your tying to push it away from you.

Katz. Quit now before your sphincter glums down on your neck and chokes you.

> You are trying to push this car up hill but until
>you can overcome its resistance its not going anywhere.

You dumbass, that ain't resistance. It's gravity! And THAT's a force. Call it resistance, if you want, but it does not equate to electrical resistance. Imagine, if you have any of your faculties left, the relationship of a 1" garden hose and a 3" fire hose. Neither of those diameters has any relationship to energy or force. But the 3" hose (like the one I am using on YOU) carries nine times the volume of water at a given PRESSURE than the 1" hose.

> When it is at the top of the hill and not resting against you while
> pinned against a wall then it has some energy to release as it rolls
> downwards. Can you see the relation to charging a battery?

I can see your relation to a common urinary ant.

>I'm beginning to think you copied your material from some book and
>did not fully understand what you were talking about.

Yes, I can now see how your understanding would be on that level. When God passed out brains, you thought he said "trains" and told Him you'd take air, instead.

>>Yes, that's called "I-squared-R" loss. Loss, because heat is
>>conducted, conveyed, radiated, and lost.

>Oh it is, is it? What your saying is it is power loss.
>No kidding eh? I thought I said this before.

You did. But you don't understand much of what you're saying. Like that shit you spouted about amplitude modulation?

>P=v*i P=I-squared-R so what? ...What your getting at?..
>stick with me here Bill, your fading on me.

I know. Just remember that "fade" is relative to the observer.

>By the way we can change the battery resistance. By changing the
>level of charge in it. By changing the battery temperature.

Ri--ght, Katz. And every time you jump off the ground, you're actually pushing the earth away from underneath you.

>>Good. But you can control the current, too, which will change
>>the voltage. You can do one or the other or BOTH.

>Wrong Bill. Current is a product of voltage divided by resistance.

Huh? "Product" is the result of multiplication, you silly horse's ass! Current is the QUOTIENT of voltage divided by resistance.

Nevertheless, I told you the good word. Current in a recharger CAN most assuredly be controlled, Ignats, same as voltage can be....

>by changing the current it would mean that the voltage WAS changed OR
>the RESISTANCE changed.

Not necessarily, shitferbrains. Think about it. You've heard of voltage regulators? Well, you can use 'em as current regulators, too.

Go get yourself a Marvel comic book where that lesson is taught on
page 9.

>Current is the result of one or both changing.

Or the other........

>Its like saying I can change the water coming out of the tap.
>Yes you can if you increase the tap pressure or open/close the tap.

THAT, my dear nescient fellow is not necessarily true. Go back to
your Kindergarten Physics book and look up "restricted orifice" for
starters..

>The amount of water flow (current) depends on the resistance in the
>tap (open or closed) and the water pressure (voltage)

And several other factors that are over your head....

>Would you like me to mail you a book on "Electricity Basics"? It is
>from my junior high school days. Maybe it can explain it in terms you
>will understand better.

Know what, Katz? You remind me of that cartoon, titled "The Last
Great Act of Defiance", where this little mouse (you) flips the ol'
middle finger at this bad-ass eagle as he swoops in for a meal.

Problem is....your fingernail has a nasty ol' booger clinging to it.

>>> Again, you can lower the current by lowering
>>>the voltage or the opposite to increase the current.
>>>It is this voltage control that helps to makes up a good
>>>charging system.

>>No. That statement is very misleading. Voltage control only makes
>>for a passable "consumer electronics" charging system. A GOOD
>>charging system has BOTH voltage control AND current control.

>Do you know how current is controlled? By increasing resistance.

Or decreasing it. Or changing the voltage. Or a combination of both.
Or even by other means using a voltage regulator and a pass transistor
with a calibrated emitter resistor.

>Do you know how current can be measured? By passing it through a
>resistor and measuring the voltage drop.

Unless you perform the division, that only gives you the voltage drop,
and even there, grave inaccuracies or circuit instability can result.
Think about that and its sublieties, Ignats. Do you want me to teach
these principles to you?

>You are forgetting what current is.

I am? You gotta be shittin me.

>What you see to be trying to say is "power loss is the cause of heat"

Power not delivered as work is heat.

>No kidding! Heat is caused by resistance ..

Ohhhh noooooooo it isn't. It's caused by ENERGY.

>I don't know how to say it any simpler Bill.

You don't know how to say it, period.

> And yes we all know "I-Squared-R" is the
> equation to figure out power...get off of it.

Then remember it. And KNOW what it means. I^2*R means a lot more
than E*I when it comes to recharging batteries.

>>>Any faster and it does not become efficient any more.
>>>Also note that heat also speeds up chemical reactions.

>>That is only a general rule; not an absolute. Heat does not affect
>>some chemical reactions, and it "confuses" others.

>This IS one factor that effect the charging of a battery. I'm not
>going to get into "some chemical reactions" we are talking about
>batteries here.

You WERE talking about heat from chemical reactions without knowing
what you were talking about. I'd get away from it, too, if I were
you.

>> For instance, all
>>materials have a temperature coefficient. Most are positive. That
>>means that as temperature increases, so does resistivity. So you
>>cannot make a bold claim that heat speeds up the reaction, because it
>>can, under many circumstances, slow the reaction.

>Bill we are talking about batteries here not the temperature
>coefficient of other materials. Stick to the point.

I did. Did I lose you? Where?

>>The issue there is very clear, too, but not as you proffered. To
>>charge a battery, an EMF must be applied that's greater and opposite
>>to the EMF of the battery. Once that condition is met, then a given
>>current flow will commence, and the battery will begin to charge.

>Gee Bill I"m not going to repeat every I said. Start reading from
>the Beginning again. You seem to have a dictionary of your own terms
>and unless it is said the way Bill want it to sound its not right.

NOW you are getting the message. Yes, it is right, the way I say it.
It is wrong, the way you say it.

>Get off your high horse.

If and when we get to discussing news photography, I will. But Katz......you are challenging what I do for a living and what I studied for many years. Yes.....I am calling the shots and you are peeing into the wind and whining when it splashes back on you.

>You know best..

Yes, Katz, in this field....I do.

>I have a better Idea of where you can stick them.

Ok. Bend over. And spread 'em.

>>SAY WHAT????? Yo Katz? Knock - knock. Anybody home? Lead acid
>>cells, like ALL batteries, have lowered internal resistance as they
>>are brought up to charge.

>Oh really now? So if I get close to a full charge of lets say a
>gell cell battery the resistance will drop? If this is the case
>then Current will rise. The battery will never stop charging.

Oh, geezus, Katz. As the battery charges up, its terminal voltage (EMF) rises to decrease the difference between it and the charger's EMF. THAT drops the current flow.

>Ever monitor the current and voltage of a charging gell cell battery?

Katz. Hey Katz! (I design UPS and battery-backed systems. Some as big as a room.)

>Notice you have to increase the voltage when the current drops during
>charging? Its because something has changed. Gee Bill what can that
>be??!!? Well the voltage has stayed the same. The current dropped..
>what left?...Resistance. You do the math Billy. Is very basic
>electricity here. Resistance has increased. This happened during
>charging.

You are one dumb doode, Katz. Very, very, dumb. The voltage does not stay the same. Apply 13.8v to a battery resting at 11.0v. Initially current will be high, but as the battery charges up, 11.1, 11.2, 11.3, etc, the decreasing differential between charger and battery results in a down-ramp current function....regardless of the fact that the battery's internal resistance drops (at a slope less dramatic than the slope of the voltage increase). The voltage slope is dominant, Katz. Now quit being stupid.

>What school did you come from? Did you say in one of your posts that
>you are an Engineer. Is that an Electrical Engineer? You don't do
>house wiring do you? Seen any good fires lately?

Several very, very good schools, Katz. Yes, EE. (And FCC 1st Class Radiotelephone License with Radar Endorsement. Member of IEEE, ISA, APCO, NARTE, RCA, and MENSA. And yes, I have two wires for you; one to stick in your mouth and one for your.......never mind.

>> Whatthehellareyoutalkingabout??????

>Something you seem to have great difficulty understanding for a
>Engineer.

Do you really mean that, Katz?

>>Whatcha been drinking tonight, Tooth's? Foster's?

> Having difficulty defending your points? Is this what you have
>to result too when your up against a wall?

>Seems like we all have seen this before.

Have we now? Who is "we"? What exactly are you trying to say, Kitti?

> You've changed, why such a change in tongue? Is it an attention
>thing? Is it that you know better then everyone and as soon as
>someone else comes along you get all huffy and puffy? don't worry
>Bill, no one is going to take your toys way.

They can't, Katz. And, the deal is that you are a news cameraman.
You play radio a little for a hobby. You may have read a good CB
book, and maybe studied the Radio Amateur's Handbook a little; enough
to be dangerous.

And you want to degrade and call me wrong for what I've studied and
worked for over 30-years? Oh geezus..... but read on......

> I may not have the writing skills to attack you like you do to
>me or others,but I can point out where your dead wrong. My Engineer
>friend.

I see. Well, let that explain my utter contempt and disdain for you
and the horse you rode in on. You are not capable or qualified to
even come close in judging my technical foundations, but you do it
anyway. You are an insolent, silly, little boy who hides behind his
keyboard to snap, bite, and peck because no matter how wrong you are,
you are safe. You remind me of this little asshole when I was a kid,
who used to finger me from behind his mammy's skirts.

>Billy, A op-amp is a comparator.

No, Katz. Not all op-amps are comparators. Slew rates and hysteresis
parameters of many op-amps makes them unsuitable for comparator duty.
Comparators are op-amps, however.

>>> This is why time limits are set as to how long the battery
>>>should be left on charge. They also assume that the
>>>battery is fully drained before charging.

>>No, Katz. As I explained in my article, typical consumer electronics
>>applications use a DC source to feed the NiCd pack through a series
>>diode (avoids reverse polarity damage) and a series resistor
>>(self-limits the C/10 rate). This is a very cheap, but very safe
>>method for general purpose recharging. The only liability of such a
>>mass produced concept is that the NiCds don't reach 100% charge
>>because of conservative designs.

>Oh? what is 100% of charge?

1.44v per cell, Katz. That's max. 1.40v per cell is ok as a safety margin. For lead-acid cells, full charge is 2.1v per cell and the safety margin is rather wide, unlike NiCds.

>What conservative designs stop them from reaching full charge?

Manufacturing tolerances in: the transformer, the series limiter resistor; resistance of the chokes; doping of the silicon series diode. ANY overcharge will shorten a cell's life. So conservatism is designed in.....which means some degree of undercharge.

>>Well, Katzenjammer, you may see it that way, just as you "see" and
>>claim I started flames and attacks betwixt thee and me. But as you
>>are dead wrong and erroneous about that, you are wrong and in error on
>>MUCH of your post above.

>We will let others be the judge, shall we? Your opinion does not mean
>much.

And HERE, Katzenjammer, you are finally right. My "opinions" really do not mean much and certainly no more than anyone else's. Trouble is, Katz, when it comes to electronics and radio, I do not render "opinions" except in cases where I am asked which radio is best or what's the value of a used PRO-2004, etc. As far as this discussion is concerned, I have talked about what I KNOW, Katz, and that differs from your goofy, amateurish "opinions". And the difference is a country mile. I am NOT giving you my opinions, Katz, except when I speculate on which branch of the lizard family you're from.

> If you want to turn a serious discussion into one of your flame wars

This isn't a serious discussion, Katz. You are arguing for your opinions, and I am telling you what is. And what is not. You are debasing my education and profession. I am working on YOU.

> If the above is an example of your understanding of electronics
>then perhaps you should stick to C.B. radios and crackerjack box
>Engineer diplomas eh? Two can play the game Billy, but not always will
>it be by your rules. You wanted to know mine..well you'r going to
>find out if you keep this up.

I really do hope to "find out", Kitti Katz. And I -=AM=- going to "keep it up". You laid some heavy duty lying accusations and slander on me, enough that you're going to oscillate back and forth through your sphincter before I'm done with you. There was no call for you to come on to me like you did.

Now it's my turn. :-)

591. Re: External Amplified Speaker

Newsgroup: rec.radio.scanner

If you'll be using the scanner in the car, an external speaker is a MUST. Even in the home, it will definitely increase the volume and quality of the audio.

I use an old Midland "CB" speaker in the car, but the one that Radio Shack sells for $14.95 is just the same. No need for the amplified model unless you listen to the scanner on the freeway with the windows rolled down!

Get the speaker. You'll notice a BIG difference.

>Well Bill how are you doing?

Fine, thank you. It's nice of you to care.

>This has gone on for over 2 weeks now I guess.

Since July 14.

>I feel that you have been appropriately dealt with, & I think
>others do also.

Good.

Now it's my turn to deal. :-)

>You have shown yourself to be a liar when you said I did not have
>valid PO Box to mail to so I posted the image of the postcard you sent

THAT was the second one I sent, shitferbrains! The first one was returned marked "No such addressee". You fussed and sniveled, so I tried again. It worked. Tuff shit. PO Box mail gets sent back all the time. I know......I have one, too.

>& you said you would give Mr. Kaose a warning actually you did kick
>him off your echo.

I did warn him. He ignored the warning and posted off topic and inflammatory a second time. So I game 'im the same Size #13EE crosswise that I gave you. He had it coming. Just like you did.

>Your conduct on this echo has been brought to the surface for
>people to judge on their own. You have heard their opinions,
>which are mixed.

Remember the deal about opinions, Mackey. Opinions are a lot like assholes. Everybody has one, and they all stink. Mine's #1 and yours is a close second. The rest of 'em are barking at our heels.

>At this time I am willing to bury the hatchet with out further
>issue provided you are willing to do the same.

What does that mean? You've done nothing BUT attack, while I have ignored the hell outa you. You're locked out of my mail box, and except for the fact that I like to watch nincompoops at work, I'd have you in my newsreader killfile, too. Just that you don't harm anything here on the newsgroup. So I like to watch you and your antics. You've been good for some laughs around here in the shop.

>It is your choice.

Nooooo, it's YOUR choice. You've been keeping it up. I've been laughing at you. It's easier to stop shooting than it is to stop laughing anyway.

>By now you know I have more than enough resources to keep this
>up for an indefinate amount of time.

Good. See how far you can go. What the hell, man, don't quit now. People might think you don't have any "hair". Or any lugnuts on your wheels.....

> But honestly, I would rather let these threads die

Then let 'em die. Do what you want to do, John Mackey.

> for the good of all & hope you would see it this way also.
> Perhaps we may never agree on anything else, but I
> hope we can agree on ending this.

How I see things doesn't matter. It's how YOU see 'em that matters. You've NEVER said anything worth a shit that I bothered to see if I agreed or disagreed with. Any disagreement I have is certainly no concern to you because I haven't expressed it.

>Should you decide not to "bury the hatchet"

What is there for me to bury, John Boy? What have I been doing to YOU? You don't have a mail box that I can load up. You don't have any intelligence that I can insult. What exactly could I do to "bury the hatchet" that I haven't been doing these past three weeks?

I have NEVER sent you a newsgroup mail or an e-mail to your ham club but what it was a response to something you did or said FIRST. I have not been the aggressor. What could I possibly do that would "bury the hatchet"? Please state clearly what you mean and what the implications are for me.....

> then I will use my
>resouces & continue as I have to date. You know the many
>things that have happened & I don't need to go into specifics.

That will be fine, too. I would not pretend to busy myself with making choices for you. You need to make your own choices. And suffer the consequences thereof.....

>What I am suggesting is a live & let live policy between us.

Geezus Hortense Kriste, Mackey, what the hell are you talking about? I dropped off a FAQ here on July 14. Never said a word to or about you. Never gave you a moment's thought until on July 21, YOU posted the following piece of sodden drivel:

Sad but true. He schrewed up a nice Fidonet echo, I wonder what's
next, rec.radio.scanner?

> And I don't do it for my health, either. I got publishers yanking on
> me from one side and hackers on the other. About every couple of
> years, I just have to give in and crank out another one......or get
> the snot beat out of me by both sides.... :-)

I'll bet there are plenty of volunteers for that. WHere can I sign
up??

> Funny thing is, though, I come on here to drop off an informational
> and educational FAQ a few days ago, and wingnuts, Hubey Duffster and
> Petey J. PoopBreath got the urge to have a go at me.

Funny how you have that affect on SO MANY people, isn't it?

> The REAL funny thing is that I kicked ol' Duffster's ass off the
> FidoNet SCANRADIO forum about six months ago for acting like an
> asshole. So he frogs onto this public anarchist forum to drop his
> britches, pee and poop all over the place so the world know just what
> happened to him and what a jerk I am for having the audacity to give

hahahhahahahahahahahaha, shit Bill you kicked EVERYONE off who you saw as any kind of a threat to you or wouldn't kiss your ass. You would carry on & be extremely condesending & make up stories to their sysop & whine. THen you would tell them if they want to respond to do so via netmail & when they did that you would tell the sysop they were harassing you. Get the fuck out of here with your lies Bill.

> 'im the boot. Hell, I kicked his ass so hard, me and HIM had to go to
> the hospital on three legs to get my foot surgically removed from his
> grumpstump. He's still a little "sore"....if you know what I mean.
> <wink - wink - nudge - nudge>

I wonder what the Fidonet administrators would think of you bragging about kicking people off like you are now?

==========
END OF JOHN MACKEY'S FIRST POST
==========

Since then, the ratio of your posts to and about me have been 15 or 20 to one of mine. I don't see where the issue of "live and let live" rests on my shoulders, John Boy. So please do explain that apparent anomaly.....it is very confusing........

>Fundamentally, I do respect your knowledge of scanners & for that
>reason I NEVER attacked you on that topic. Mainly, your attitude
>& actions are my objection. That is likely something we will not
>agree on.

Oh well.....hell. Can't win 'em all. But talk about lying? Want me to go grab and repost the several of your posts where you DID attack me on my knowledge and credentials in scanners and scanning? I'd be glad to do it, if it would straighten anything out.

>As I said above, "it is your choice".

No, Mackey, it is not my choice. It is your choice.

> We can either stop or continue, I am prepared for either.

That's good. So STOP ..... or continue as suits your fancy. Sheesh, you don't need me bottlefeeding you.........

> As indicated by the users of this group, they would rather it stop.

So stop, then.

>The decision of wether this stops or continues is yours.

I believe the record, starting with your first post, will amply show
that the decision is yours.

>programmability. What frequencies do they cover?

Okay, here's the info, straight out of the user's manual on the BCT-7.

Frequency range Transmission
29.0-30.0 MHz 10 meter amateur
30.0-50.0 MHz VHF Low band
118 - 137 MHz AM Aircraft
137 - 144 MHz Military Land Mobile
144 - 148 MHz 2 Meter Amateur band
148 - 174 MHz VHF High Band
406 - 420 MHz Federal Gov't Land Mobile
420 - 450 MHz 70 cm Amateur Band
450 - 470 MHz UHF Standard Band
470 - 512 MHz UHF "T" Band
806 - 956 MHz Public Service (except Cellular)
(806.0000 - 823.9875, 849.1125 - 868.9875, 894.1125 - 956.000)
26.965-27.405 MHz Citizens Band

The BCT-7 comes pre-programmed with:
1,142 programmed Highway patrol frequencies
5,185 programmed police frequencies
459 programmed Department of Transportation frequencies
160 programmed Fire/emergency frequencies
178 programmed news frequencies
9 programmed weather (7 NOAA and 2 Canadian Coast Guard)

There are spaces for:
25 user-programmed Highway patrol freq.
25 user-programmed police freq.
10 for DOT
10 for fire
5 for news
and 25 fully user programmable.
Grand total: 100 programmable frequencies.

I used to have a BCT-2, which I believe is similar in operation to the
BCT-10, just without the neat case and an updated list of frequencies.
No programmable channels. Basically, you can have it look for the HP,

the police, the weather channels and the DOT.

Hope this helps!

Outta here.

If you had researched and tested NiCds as much as I have, you'd
know...........

....that the voltage drop/discharge is most assuredly a slope and
no where near "flat" like that of mercury and lithium. In fact, the
decay of a NiCd under discharge goes from 1.4+v at full charge to 1.0v
at full discharge. There is no flatness in that range - it is a
downward, fairly linear slope.

....that when fed into a regulator, the current drain will be
relatively "flat" or constant up to the drop-out point of
the regulator, but the cell's terminal voltage would still decay along
the "ramp" function.

....that internal resistance most definitely changes over the charge
cycle of the cell.........

....I don't mean to be contrary, but these issues are easily proved
with a simple test apparatus. Expertise is not required......

>it with the current model. I'm unable to compare these two units. Does
>anyone have any input? Thanks

I switched from a Pro-43 to a Pro 60 not too long ago. I lost 824-829 Mhz
(no big deal) and gained some coverage on the lower end like the FM BCB. I
also am no longer plagued with images from the TV transmitting tower a few
blocks away. Don't really notice much differnce in sensitivity but I don't do
much VHF/UHF dx chasing with it to make a comparison. The only negative I
can find is it seems to discharge the nicads a bit quicker. I have no real
data on this, maybe the old nicads are just wearing out. I would be interested
if anybody has looked into this aspect of the Pro-60.

I am interested in buying a two way radio, non CB, with range for up to a
mile or two. Is it wise to buy one that operates on one channel? Would
interference be a problem?

one that i was looking at was a maxon hand-held 2-way single channel
radio (up to one mile) ; 100mW RF power, crystal controlled freq.
Is this good?

thanks

I thought a 1992 vehicle would have a mechanical pump
not an electrical one. I also never thought of this as being a
possible source of noise. Interesting, thanks for sharing this.

I guess you could turn the ignition to the start position without
starting the motor so that the pump would turn on and see if the noise
is present with the engine stopped.

CORRECTION
Contrary to our first reading, it does not appear likely
that any hams will be subjected to filing EIRs. Word to the wise:
Don't read government legal opinions while your 9 year old daughter is
holding a big birthday party with a crowd of 9 year olds :)

While the ruling does place additional rules and compliance
issues upon Amateur Radio stations, I'd guess that having a
federal standard will help to prevent lots of local
municipalities from creating their own, usually ill
considered regulations on RF emissions.

We corrected the web article shortly after posting on Usenet
(which you can retract once posted). Oh well.

Please tell us what your interest is. Is it to join the flaming wars,
or is it to contribute to the subject.

What are you basing your statement on? You have not given any
examples. For such a statement to be taken seriously it must be
supported with some facts.

As for cutting losses, I see nothing to lose by defending my points.
If I am wrong, then someone will hopefully correct me. If that happens
then maybe I will learn something new. I also think It can be done
with out a personal attacks like Bill has chosen to do. If you
followed the conversations you will notice that BILL chose to attack
instead of defend. I did not start this one. But I have defended my
self. I have no need to continue this any more. Would you like to?

By telling me to "shut up" you are provoking a fight. Think, was your
comment necessary and what do you hope to achieve James?

In general, the media dispatch frequencies are in the 450-451 and 455-456 range (some repeaters, some simplex).

The Interruptible Foldback (IFB) frequencies are usually in the 161-162 range. Some stations
around here use this range; others have their IFB in the 450 range.

Yup just like you said. You can use them as current regulators, too.
This is done by changing the voltage drop in the regulator circuit.
Basic ohms law Billy. It resistance increased and decreases in the
series circuit. You are not changing the current the current changes
as a result of the change in series resistance in the circuit and the
voltage. i=v/r

If you want to look at it your way Billy then you can say that you are
changing the current by controlling the voltage and series resistance
in the charging circuit. feel better?

>THAT, my dear nescient fellow is not necessarily true. Go back to

Interesting play anyway Ed and Kim. I went to the FCC server and got down the whole 1 meg Word Perfect 5.1 file anyway. Haven't read it yead, but I will. It probably is close to the ANSI standard stuff that is already in the ARRL handbook and not a bad view of life anyway. Actually, if you look at the charts and do some real thinking, the curves and distances for you to use in plotting "safe" spacing between you and your antennae, they are not all that unreasonable. When laying out my more recent antenna arrays on low band stuff for the vertical arrays, I did the check runs for the space required by the new projected standards and my operating position.

What I found was interesting from a far different perspective! Considering that feed line lengths are part of the limiting factor on how far away you can afford to go to get to an antenna and the higher the frequency is, the shorter your pocket book gets, a curious thing happens.

There is so much interaction between vertical arrays and other vertical arrays that are higher than them then the whole business of how far away they have to be from the shack is somewhat moot! If you lay out a plant with anything like the right minimal spacing so that the bigger and taller arrays don't tear up the shorter higher frequency fellers, the spacing from the user is so far above the proposed new standards that they are, in effect, meaningless.

To keep a 160 meter vertical from tearing up an 80 meter 4 square array takes about 600 feet of lateral space separation.......

Plot it all out with MN or whatever.. You'll be surprised. It takes real work to figure out how to hold interaction down without spacing separations like that...

After having worked in the broadcast business as well as being a ham, I really don't want to put an indoor loop antenna in my appartment and then feed 2KW PEP into it, nor do I want to put a three element beam on a roof top rotator right above me in the attic and toss 2KW PEP into that either. Surely running the limit on RTTY that way must make it worse even by common sense.

The charrts that are there are interesting. Mobile unit field levels are also interesting when you take a look at what is happening there.

High power VHF stuff does present hazards...

For you to have simply gotten the attention of some people and perhaps piqued their interest in the issue, may have helped..

Oh knowledge of the affair isn't really required! Product liability, for example
transcends all reasonable sane limits for time elapsed on that, with or without

knowledge.

I am familiar with one lawsuit now going on where the product involved was built in 1978. The claim is the gate design on a cattle trailer was defective and the user had the gate come open last year and the cows fell out and caused a massive traffic accident.

Allegations seem to be that because the design was copied from another product back in 1963, it is really not the copiant that may have the final liability, but the party from which the design was COPIED!

For millions of dollars in claimed damages.....

:)

I will be going on vacation from California to Florida. I will be driving through Las Vegas,Nevada; Arizona; Dallas, Texas, New Mexico; New Orleans; Orlando(Disney World).

If anyone has frequencies that I could use on this trip, if you could e-mail them to - Randymir@ix.netcom.com.

I am interested in State Police and also local police in the major cities along the way. And what else, any of those interesting ones that you might have!!

Thanks!!

You might want to try rec.boats.electronics. Maybe someone should start
a group dedicated to handheld GPS and LORAN receivers for inland use.. I
have an old LORAN (which I have found as accurate as GPS in some cases)
but no inland LORAN maps... Go figure...

This could get real interesting. Since the article says the station location
and all occupants are in a controlled enviroment. They consider neighbors and
such to be uncontrolled. I wonder what will happen if a neoghbor comes down
with some mysterious illness like cancer and notices he has been bombarded with
electromagnetic radiation from your station all these years could he hold the
operator liable because he had knowledge of the EPA guidelines of RF radiation
?. Also I wonder what the FCC intends to do with all the land mobile equipment
as most all is 100 watts. The article implies a mobile station operating over
50 watts could also not be in compliance with the guidelines..

You need a radio that has AT LEAST 4 watts .. you have a unit that is NOT EVEN A WATT..

I also wouldn't suggest a radio that is Crystal controlled either.. What happens if you want to change it .. or decide to sell it. Its useless to someone else.

My best suggestion is to get a radio with at least 4 watts and computer programmable.. Say.. Motorola HT-600 or something like that.

Use the TV antennae. In a world of perfection, yes there are better alternatives. In a world of practical considerations, ie time, expense etc., a TV antennae works surprisingly well. You will hear the arguement of polarization worthy of consideration. Again, try the TV set-up first - you may be very pleasantly surprised.

As an assist, use the best cable possible in conjunction with an amplifier up on the mast.

> greatly appreaciated.

One guy already said it's later, but I'll go a step further:

The structure of the radio shack date code is as follows:

<month> A <year>

Where month is the month the whatever was manufactured, and year is one
digit representing the year it was manufactured. There's no way to tell
which decade it was manufactured in, so 1996 *could* be 1986.. but that's
not really a problem.

Interesting point. You may be right. Still, it irritates me that FCC has
any questions on RF emissions and safety other than the usual "why
should you not hang onto an antenna when someone's transmitting a gallon
on it?". While at microsave frequencies and above (and, perhaps, at high
UHF), disastrous things can happen when humans get in the way of
high-powered RF fields, I am not at all certain (learned ptomes on this
newsgroup to the contrary notwithstanding) that RF emissions pose a
serious hazard at VHF and below. Certainly the Novice question-pool
question as to why one should keep the rubber duck antenna of a HT away
from one's head when transmitting seems to me not to be proper exam
material in that IMHO the jury is still out on RF problems at VHF and
below.

I know, at least, that I've used HTs with rubber ducks for over twenty
years and haven't noticed a thing other than the financial drain of buying
battery packs!

Just to clear things up... the BCT-10 is a pocket-sized (like a radar detector) device that ONLY notifies you when you are within 3 (+/-) miles of a highway patrol vehicle (it pick up the repeater in each patrol car that is activated when the patrol officer uses his radio or if the dispatcher transmits). It is simply for allerting you, much like a radar detector.

The BCT-7 is a decent full-function scanner with the ranges you stated earlier. I have this scanner and I love it. It has great coverage and good recieve when used with a good antenna. It's easy to program, block, and scan individual banks continuously. Also, it's relatively small and easy to mount because of it's size.

Hello,

Please your opinions on the handheld wide range scanner:

ALBRECHT AE 300 SSB

100 kHz - 2060 MHz
AM, CW, SSB (USB, LSB), NFM, WFM
1-999 kHz in 1 or 12.5 kHz step
1000 ch memory, 20 ch/sec

Thanks so much, to anyone who can give me any advice on this.

I just want to know how to check if I comply or not. I downloaded the
PDF from the FCC, and the measurements listed there are WAY above me.
Is there a chart available for this?
I'm not too concerned because I only exceed 50W on 10M (100W), but
would still be interesting to know.

629. AR8000 FILTER MOD DETAILS

Newsgroup: rec.radio.scanner
Date: 1996-08-06 00:00:00 UTC
From: wm8p@infinet.com
Message-ID: <4u85ud$ceu@news1.infinet.com>
Source record: 227487

Hello AR8000 owners,

To my knowledge no one has actually posted a filter mod, here is what
I did. This is my approach and I only know it works well on my AR8000.
Your results may vary. Others may have a different solution that
works better or worse.

THE GOOD NEW:
Is it worth the effort. In my opinion YES!
The search mode is vastly improved on the SW bands. Search stops
on the primary frequency and not 1 or 2 times before and after.
Readability of SW stations is vastly improved. In some receiving
instances it reduces adjacent channel interference noticeably.
On AM receive for aviation frequencies a pronounced improvement in
audio quality is noted. You will be able to select WIDE or NARROW
for AM, NFM, USB, LSB.

THE BAD NEWS:
This is a difficult mod to perform. I have been a ham for over 30
years and have extensive homebrew experience. It took all my skill
and a magnifying glass to perform this mod without damaging the
radio. IF YOU ARE NOT QUALIFIED DO NOT ATTEMPT THIS MOD!
Find a qualified helper.

There is no way to adequately describe the locations on the circuit
board to be cut and soldered too. You will have to buy or borrow
a service manual.

Study the electrical mods described below and then using an ohm meter
and the service manual find the locations to modify on the circuit
board.

WHAT IS MODIFIED ELECTRICALLY:
The 4khz filter (F4) circuit is paralleled by a a jumper that is used
to bypass the filter for WIDE reception. This selection process is
accomplished by switching diodes on each end of the filter and bypass.

Find U2 pin 11 (AM, FM filter bypass) line. Trace this line to a 22K
resistor that connects to the switching diodes (near the F4 filter).
The voltage from pin 11 is used to bias these diodes into conduction.
Cut through the circuit trace at a convenient location just before
the 22K resistor.

Find U2 pin 4 (SSB, CW filter inline) line. Trace this line to TWO 22K
resistors that connect to the switching diodes (near the F4 filter).
The voltage from pin 4 is used to bias these diodes into conduction.
Cut through the circuit trace at a convenient location just before

the TWO 22K resistor junction.

Unfortunately there is no way for me to put a schematic in for this next part but if you draw it out on paper you should be ok. You are going to mount a small switch on the radio. This must be a DPST switch.

Connect a wire from the WIDE side of the switch to the single 22K point.

Connect a wire from the NARROW side of the switch to the dual 22K resistors point.

Connect TWO 1N914 style switching diodes together to the switch common.
Connect them with the black band facing the switch.
Connect U2 pin 11 to the open end of one diode and U2 pin 4 to the open end of the other.

What you have done is to install a switch to reverse the normal filter selection of F4. The 1N914 diodes serve to prevent turning on the BFO in the AM mode and to prevent grounding when in the WIDE SSB mode.

If you have questions you may email me but if you post a reply all may benefit. I make no guarantees, your results could vary. You might not have much fun performing this mod but you will enjoy the results.

From: Joseph.Cardani@mail.tju.edu
Message-ID: <4u7nmo$gp4@mail.TJU.EDU>
Source record: 227488

Joe Moor <joemoor@prolog.net> wrote:

>Does anyone know the freq that these two birds use for dispatch and also
>air to ground?

Northstar and Southstar use the New Jersey State Police 800 Mhz.
trunked radio system for communications. Specifically, Southstar is
dispatched by Gloucester County and Northstar is dispatched by REMS
all on the trunked system. In addition to dispatch, both choppers are
patched to their respective assigned Trauma Center. For example,
Southstar uses Cooper Hospital (Trauma Center) in Camden. Medcomm
would set up the phone patch to Cooper.

The 800 Mhz frequencies are listed in Police Call for the trunked
systems, which there are 3. Troop A system is South, Troop B is North,
and Troop C is Central. You would need to place all the licenced
frequencies in your scanner, lock-out the control channel, and use no
scan delay. The system is starting to get crowded and is hard to
follow sometimes. However, these channels are system-wide and can be
heard on all 3 systems in simulcast! Ie, I can hear Northstar working
Troop B in N. Jersey from listening to Troop A from my home in S.
Jersey.

As for air-to-ground frequencies a popular one that Southstar uses is
154.265 "South Jersey Fire Net" with NO PL TONE. but they normally use
that or the local fireground frequency for the municipality that the
incident is located. All you will here here is the helicopter
contacting the LZ Coordinator (Landing Zone) for info about the site's
characteristics (eg, high tension wires in area).

But when the chopper is dispatched, the coordinates (latitude,
longitude, and heading), frequency information(air-to-ground), and
ground contact (LZ coordinator) is communicated to the helicopter.

Also do not forget the AIRBAND helicopter channel of 123.05 AM.
Southstar uses this sometimes and 123.45 as a chit-chat channel.

Enjoy,

Joe Cardani

I hope you can find this in all the crap in this group (a subtle hint for all of you who continue to hit 'F' instead of 'k' in the flames). 243.7 comes to mind. Might try .75 as well. Let me check to be sure. Aha! Try 245.75. I *knew* it was in the military bands somewhere.. :)

It's 245.75, Mike. It's kind of enjoyable, although at the last Snowbirds presentation I was at (last year), 90% of the audio was patched through to the crowdspeakers.

(And the one I was at before that (which was the one in Toronto where the pilot died), I wasn't into scanners at that time..)

>with some mysterious illness like cancer and notices he has been bombarded with
>electromagnetic radiation from your station all these years could he hold the
>operator liable because he had knowledge of the EPA guidelines of RF radiation
>?.

You bet. The lawyers will love this. But you can be sure that the
manufacturer of the radio will be sued too. Remember the deep
pockets rule. General aviation was nearly ruined because the deep
pockets rule meant that the aircraft manufacturer was always sued
when some pilot did a stupid thing and hurt someone. The legal
theory was that the manufacturer should have built the plane so
that the pilot's stupidity couldn't cause an accident. Same logic
applies here.

>Also I wonder what the FCC intends to do with all the land mobile equipment
>as most all is 100 watts. The article implies a mobile station operating over
>50 watts could also not be in compliance with the guidelines..

Worse than that, Gary, the 50 watt exemption only applies to *amateurs*.
It does not apply to other classes of licensees. They've got to certify
compliance at *any* power level. Note that "push to talk" *radios* are
exempted from certification by their *manufacturers*, but *stations* using
such radios are not. The *licensee* is still responsible for seeing that
his station operates in compliance with 47 CFR 1.1307, 1.1311, and 1.1312.

However, Part 90 *portable* radio stations are categorically exempted.
I'm not sure the FCC considers "mobile" rigs to be "portable" radio
stations. If not, *each* installation must be certified. Otherwise,
they're exempt *regardless* of power level. Cops always seem to be
"more equal" under the law than you or me.

>Whatever. You don't use return addresses so you are lying again.

You and Katz have a monopoly on the lying. I have no need for it.

>I am attempting to end a confrontation because I thought you had caught
>enough but perhaps you want more. Your approach of name calling is
>basically attacking.

Well, quit acting like a "shitferbrains" and then I won't notice and
be reminded of it. I can't imagine you "trying" to end a
confrontation that you started and perpetuated. At least, ending it
doesn't involve me. It's just something you can do......or not....as
you see fit.

>> >& you said you would give Mr. Kaose a warning actually you did kick
>> >him off your echo.

>> I did warn him. He ignored the warning and posted off topic and
>> inflammatory a second time. So I gave 'im the same Size #13EE
>> crosswise that I gave you. He had it coming. Just like you did.

>Oh Bill, can't you stop being a horses ass for once. Sounds like you
>want to continue the battle.

There you go acting like a "shitferbrains" again. No cognitive
capacity whatsoever, it seems. Damn, man, are you dense? I told you
Kaose did it AGAIN so I fetched 'im a boot like you got. I said he
had it coming like you did. What part of that do you not understand
real well? I guess an explanation is in order, so here it is: YOU
got warned TWICE by me about your behavior on the SCANRADIO forum, and
your Bossnode, Bill George, warned you at least once...very matter of
factly. So you got three warnings and advisories. But no, you had
to go unload your shorts a third time. So I gave you the heave-ho.

Now if THAT ain't "had it coming", I don't know what is. This ain't
got anything to do with battle, Mackey. You're saying stuff that

doesn't relate or compute and which makes me have to explain things all over again. After the experience with you, I cut the warning policy to just one. Kaose just HAD to test it and find out. But that's as much your fault as his. Otherwise, he might have been anle to get three warnings before getting hosed. But you had to ruin it for him. What the hell?

You accused me of your favorite habit, lying, and it was a matter of fact and record that Kaose got a warning and failed to abide it. So he got the boot. Whatthehellsthematter with that?

>You will lose, so you really should try to get along.

Lose? What's that? As fer getting along, ...man, I am really trying. But you are so confusing and peculiar and strange. Your frame of reference is sort of cockeyed and off to one side.

>(as you should know by now, I have many many resources)

See?

>> What does that mean? You've done nothing BUT attack, while I have
>> ignored the hell outa you. You're locked out of my mail box, and

>Bullshit, you have done equal amount of attacking.

How do you figure? Count the number of posts you've made, all of which are inflammatory....then compare those to my replies to you. It ain't equal, pal.

> BTW- You may have locked me out of your mailbox but I can simply
> keep changing names every time & beat you at it making you have
> lock out the new name. Then I will just pick a new name the next
> day & you'll be back where you started. I can even change mail servers!

There you go acting like a shitferbrains again. Geezus, man. You can't get into my mail box no matter what you do. But if you wish to keep acting like a blithering assbite, then hey, waste your time and money. That will be fine. It's YOUR threat and YOUR decision. No skin off my nose.

>> >By now you know I have more than enough resources to keep this
>> >up for an indefinate amount of time.

That will be fine. Do it, if you must.

>> Good. See how far you can go. What the hell, man, don't quit now.

>Hmmm, please don't tempt me! (it wouldn't take much)

A man has got to do what he's got to do. Me and the boys around here have been whooping it up and laughing our asses off at you. We even lay bets and odds now on what your next act of imbecilic idiocy will be. One feller laid 3 to 1 that you'd try to load up my mail box again yesterday, and I said, "Nah, he got smart", and took the bet.

Of course, I won. He was frosted over that one.

>> YOU? You don't have a mail box that I can load up. You don't have
>> any intelligence that I can insult. What exactly could I do to "bury

>Again, your constant insults sounds like you DON'T want to end this &
>would rather fight.

Geezus H. Kriste, Mackey, I'm just telling it like it is. I'm not saying stuff that I don't know for sure, like you're a fairy, or a nasty ol' transvestite, or a hermaphrodyte. I just say stuff that's been proved....or at least for which the FACTS support.

Take your intelligence, fer instance. You've posted 34 articles of aggressive, inflammatory attack with nothing to suggest you know anything of scanners and scanning. You didn't even mention the words. You've used every four-letter "f" word in the books and you seem to have this one-track mind or some kind of an obscession with me. Seriously, you haven't exhibited anything resembling intelligence above that of the common urinary ant. Now if I have the FACTS wrong, then please do correct me.

>> I have NEVER sent you a newsgroup mail or an e-mail to your ham club
>> but what it was a response to something you did or said FIRST. I have
>> not been the aggressor.

>Bullshit, you have sent several messages to my ham radio club. We are
>all laughing at your whinning.

See, there you act like a nincompoop again. Of course, I sent several messages to your ham club. But only in response to your obscession with me, and then only because you HIDE behind anonymous servers and fake email addresses. You seem to be unable to read (or spell).

>> making choices for you. You need to make your own choices. And
>> suffer the consequences thereof.....

>Actually, YOU will be the one to suffer. It doesn't affect me.

Cool. So if you want to make me suffer, try it again. You might get lucky. You're more apt to win the lottery, though. I'm not all that much into suffering.

>It's simple. We just stop the bullshit & attacking & insults.
>That's all, it is not a difficult concept unless you are only
>familar with fighting.

So stop, then. What's this "we" shit? You gotta go wee-wee or something? Geezus, man, what do you want ME to do? Aw, I guess I can just ignore you totally. No more e-mails to your ham club, maybe. Plop your poopy into my killfile for the newsreader. What else?

>As I said before I do believe you have some good knowledge on scanners.
>I also believe you are lying on your degree(s) & FCC license

>(credentials).

Well, I'm not. But if you must make it a religion, go for it. I am a licensed minister, too. So I can ordain you, if you like.

>However, degrees & licenses do not necessarily make a good technician
>but do indicate a certain level of knowledge. I disagree on your use
>of the term "engineer" as I have the above credentials & even then
>still won't use the term for myself, as most of us would not.

Well, those who don't......can't.

>I think your problem Bill is that you are a very negative person &
>self centered,

Oh gosh, no. But here is the deal. If you found yourself in a great big room filled with rats, mice, snakes, spiders, cockroaches, etc, it wouldn't take you too awful long to get to feeling kind of like a master, too. After a steady diet of you, Duff, Katz, and Moss, I mean hey.....can you blame me?

> you believe NO ONE can be as good as you.

Oh gosh, Mackey, in the REAL world where I come from, there's some RF and digital gurus who'd make me look like I flunked Kindergarten two or three times. It's just that whenever you, Katz, Duff and such come prancing and sacheting around, I get this warm fuzzy feeling that makes me remember to say my bedtime prayers and thank the Almighty for not making me like you fellers.

If you were in my shoes, you'd feel the same way, too. All the boys around here get to acting uppity and militant when you or Duff or Katz come dancing in.

> During the entire reply from you everything was negative except
> if it was about you.

Well, dang, I don't mean for it to be that way. It's just that you and Duff, and Katz, and Moss all make me feel this superiority complex. I can't help it, man.

> Come on now, you should be able to find something positive to say
>in any circumstance.

Like what, fer instance? What a wonderful, warm, loving, kind, intellectual you are? How much you know about scanners and scanning? I mean, hey, gimmee a clue. Put something up on the teleprompter for me, ok?

> In this situation, you could say that I have shown
>you ways of doing things that you could not track,

But that isn't EXACTLY true......

> such as how I was able to find & access SO MANY different
> anonymous servers. (this is something you complained about to my
> ham radio club)

Geez, man, any low-life can do THAT kind of stuff. It would take more of a man to pull your parlor tricks from a real address and ISP. Your cousin, Hugh Duff, pulled that crap from AOL for a few days before they gave him the heave-ho, then he went over to HotMail for a day before they flushed his ass.

Anybody can pull that stuff, Mack. You call that HONOR and INTEGRITY?

Anyway......if you want peace and prosperity, you hold the power. I'm not real sure what I can do other than what's already mentioned above a ways. I'm always open for clues and hints, of course.

==========

Very interesting, Mr. Browning. You belly-crawled to my ISP behind my back over something that boils down to what you "don't want me to do."

The *funny* thing is that I am not breaking any laws like YOU are! I am only doing something you don't want me to do. You, however, are a criminal....by your own admission.

Listening to cellular telephone calls is a violation of the Electronic Communications Privacy Act of 1986. NOT that I care, mind you. Just interesting how the "pot calls the kettle black" and fails to tell the complete truth in his one-sided "snitch report".

YOUR below newsgroup article succinctly captures a frank admission that you listen to cellular telephone conversations, and it also suggests from other admissions that you monkey around with the cellular data/control system. That might be another crime, not to mention a very interesting thing to the phone company.

And THEN, to beat all, you use THIS newsgroup and your ISP to further enhance your criminal activities and to boast of them. I am under the impression that newsgroups are not supposed to be used for or to promote illegal activities.

You're quite the gentleman and scholar, Mr. Browning, operating on DOUBLE standards! You will understand, then, my curiosity if you go to church on Sunday; vote in elections; and support anti-crime legislation; and stiff penalties for criminals......

.....like you support stiff penalties for newsgroup posters who say
things you don't want to hear.

Tell him Ken

I too do this all the time. I have a freq counter and this makes it
very easy! I know where 90% of the cell towers are and what freqs they
are on and I have maped them out. I can follow cell calls (most of the
time) by just listening to them talk. They usally tell where they are
and this makes it easy to track. I dont live in a big city but it is a
pretty big town.

>Sorry to say this.

Yes, you are correct, to some extent. The trunked systems and digital encoding (scrambling is easy to defeat) have made the hobby a little less easy to follow. My contention is there will ALWAYS be something interesting to listen to out there. Many smaller police and fire departments will never go to trunked systems because of the expense and their VHF or UHF systems work FINE for their purposes. Even if you live in a large city, try listening to some of those suburban departments-they have the same calls, such fewer of them. There is also, depending on where you live, Coast Guard, air ambulance helicopters, ambulance-to-hospital frequencies (which at least in my area are still on VHF), and news media, although they are increasingly using cell phones for the "breaking" news, you can still get some interesting "tips" if you listen closely or if they are working a long-term news story they will sometimes use the radio. I really don't think that at some day in the future EVERYTHING will be trunked.
If some of you technical radio people out there have some input to confirm or contradict my opinions, please post! I look forward to your input.

Dear Scanners,

Yes, the days of the scanner are numbered.

When I was a kid, it used to be fun to listen to police, fire etc. etc.

But now trunking is getting to be the norm, especially in larger markets
and the celluar phone is now used for anything important.

yes, you can still copy a little trunking but it does take a lot of
effort and scrambling is also becoming more and more.

The prices of scanners also are going out of site very rapidly.

Unless you live in a small market where the cops don't have the money to
use trunking; scanning is going to get more borning.

Sorry to say this.

Eric Buxton wrote:
>
> OK, I would like to purchase a handheld scanner in the near future, and have
> the following questions:
> a) what channels are "musts"

Not so much the idea of channels, but rather, frequency ranges. You
would probably want to have VHF low (29-54), VHF high (approx. 137-300),
aircraft (118-137), perhaps the military ranges (200-400), UHF (400-512
or so), and 900 to about 1000 (All freqs in mHz). If you want the 800
region, it will be blocked for cellular on all new radios. There is
lots of stuff there...

> What is in the 800MHz region?

Trunked public safety (police, fire), trunked common carrier (i.e.,
cellphones), aircraft public phones, and a variety of other land mobile
services such as taxis, utilities.

> b) Are Radio Shack Scanners made by Uniden? They look like it.

I heard some of them are.

> c) Any features that are "musts"

Get at least 200 channels, divided into 5 to 10 banks of channels (DONT
go for only 10, 16, or 20. Thank me later). 100 channels a bare minimum
these days.
Most scanners have scan delay.
Pushbutton to illuminate the display and perhaps the buttons too.
Socket on side for charging batteries if you use NiCd.
Look for decent audio output. Many handheld scanners get washed out in
noisy environments.
Headphone jack.

There are loads of other features you can get on a scanner (the AOR8000
for example, which I have), but if you are just starting out, start
simple and you will wind up not spending wads of dough only to get
disenchanted with the hobby cuz your scanner is too difficult to use.

> d) I know that the newer ones have a cellular lockout, and there is a simple
> fix, but that isn't important.

Unfortunately there is not a simple fix for a given scanner. However,
you can get special "boxes" which will convert the cellular range into a
range your scanner can hear. You can also have certain modifications
done by places that sell scanners, but only a few models can actually be

converted, if at all. Whoever told you that is pulling your chain -
it's not a simple diode clip like it used to be. All brand new scanners
sold in the US since April 1994 have the cellular permanently blocked.
There however are still some scanners (the ARO8000 is one of them) that
you can get in the US with cellular blocked, but via an EEPROM
reprogramming effort you can undo. This requires a special cable
interface, software (or knowledge of SQUIRT) and a PC with a free COM
port.

> e) Any brands or models to avoid?

Some people give Radio Scrap a bad rap, but I find them to be just fine
as far as the quality of their scanners. They have a pretty good
selection too. Now their motorized toys on the other hand...

Just got my Scout recently and all I've been getting is 900 mhz paging services. I'm using the mini antenna that came with it. I'm fairly close to Chicago (16 Miles) in a high developed (crowded) suburban area. So far I'm alittle disappointed with the Scout, but I love the AR8000. Jurys still out though on the Scout though, maybe if I could filter out all of the 900 Mhz and above.

First of all, the above test measures internal resistance at TWO
points, one at the start of the test and one at the end.....where the
pack is NOT fully discharged. (Read down the test parameters a ways,
and you'll see where I included it.) You COULD, every five minutes or
so, pause the test and do the Ri(x) test so as to have a continuous
set of data for it, too.

Secondly, you COULD dispense with the regulator altogether if constant
current is a concern. THEN, over the period of the test, both the
terminal voltage AND the current would fall onto a down ramp function.

> Where this *really* falls apart is the point where the cell or
> battery is nearly discharged and the voltage per cell is down around 1
> volt or less. You can't legitimately measure the open circuit voltage any
> more because the open circuit voltage will "rebound" over a period minutes
> or hours when the load is removed and this "rebound" is not totally
> related to the internal resistance but is also a chemical effect.

It won't *fall apart* if you take continuous data through the course of the test. If and when you run into an asymptote or other discontinuity, then terminate the rest and evaluate the data you have. There *won't* be any asymptotes through most of the test, however, with the greatest chance of one occurring as the cell reaches a full discharge state.

> What I'm trying to say (it's clear to me anyway), is that the

> internal resistance was.

Well, if you don't think it through, sure...it can be difficult. However, Kirchoff's Law can be applied on a continuous basis to keep a running record of the internal resistance as the dynamics of the circuit vary.

> As you say, you have to watch things very closely in order to not
> get trapped into the old GIGO syndrome. In this case, I don't believe

> source and an internal resistance without coming up with some wrong answers.

THAT all depends. If we were doing a study for a 4-yr mission to Mars, sure. But to create some practical principles and rules of thumb for the hobbyist and layman consumer, No! In fact, and in truth, the internal resistance of a cell is some value (Ri) IN SERIES with the load (Rload). When all voltages and currents in the circuit are quantified and evaluated, then internal resistance can be inferentially derived with a high degree of confidence to provide specs and conditions for the hobbyist's practical application.

For a trip to Mars, we'd want a megamillion dollar budget and a staff....to qualify a $2 cell........

> If I were going to measure the internal resistance of a nicad, I'd

That would be fine, but instead of rapid switching, it could be done every few minutes instead. The main course of the test will not have any anomalies.

> I've been meaning to build an automated charge/discharge test
> setup for nicads so I could finally (for me at least) either confirm or

You should research old back issues of the NASA Technical Journal where the memory effect was first debunked. Might be some good clues and qualifying info there.

Technically, there is no reason for it to cease working
depending on your location. If it failed, there is a problem with the
unit itself.

What is the "map" setting that you refer to? I own a 45 and have
no idea what that could be.

Just on a hunch, did you switch it to "AutoLocate" mode on
arrival in Tanzania? When you first bring the unit up the unit will
start a satellite search assuming you are in the "vicinity" of its last
fix. If you have moved significantly, it will try to lock onto a set of
satelites that are not visible. To avoid this, you must switch it from
"normal" or "battery-save" mode to "Autolocate". This will cause it to
search for ALL satellites and re-download the satellite almanac. This is
a lengthy process. It must have a satellite visible for at least 15
minutes to perform this task.

Double your first IF frequency, add it to 123.8500. If the result lands
you in the 869-894 Mhz range, you are hearing a cellular image! (and you
probably have a triple conversion receiver!

For sale:

Scanner Frequency Directory for Northwestern Ohio and Southeastern Michigan. Also includes the Windsor area of Ontario.

Tenth edition, copyright 1995 by Daryll Symington, published by Radio InfoSystems.

I won this as a door prize and since I'm in New Hampshire, it's of no value to me, although it looks like a very good and complete book, and is new condition.

Lists government, utilities, private business users, and details of how many of the users are organized, such as a description of which cars and dispatch points have what nomenclature, and what the numbers of the cars mean, for many specific police departments, fire nets, and so on.

Descriptions of the organization of the various departments are unusually complete it's more than just a list of frequencies and users.

I'll mail this to you for $10.

Thanks,
-Pete

Good subject! It comes up ever now and again.

First of all, there are MANY so-called "scanner databases", every one
of 'em a reinvention of the wheel, meaning that all over the world,
hobby programmers have had the "unique" bright idea of making an
easy-to-use frequency database manager for scannists.

Therefore, there are (literally) dozens out and about that meet your
specification and each offers to be the first or the best, or both.
All are more or less equal and all are shareware, meaning there is a
cost of $25 or more, if you keep the program. "Scanner databases"
definitely DO the job, but there are liabilities and disadvantages.

The greatest disadvantage is that that these "scanner databases" have
rigid or proprietary Input/Output formats. You wouldn't be able to
take a list of frequencies from a newsgroup, for example, and drop it
into a "scanner database". You'd have to hand type them all in.

Likewise, say someone here on the group needs a list of freqs for
Podunk, Iowa, and you have them. Many "scanner databases" will not
let you Output to a file....print, yes, but not to a file. All
"scanner datases" have other limitations of size and space for entry
of other information that is needful of a good database. "Scanner
databases" cannot "grow" as you think of more data that should be
added. You're basically stuck with what the programmer thinks you
need, and that's it.

Therefore, since they all cost hard earned money and since all are
severely limited or restricted and since you will outgrow a "scanner
database" at some point in your scanning "career", and find it a huge
effort to upgrade to something more powerful, I will strongly suggest
to go straight to the "something more powerful" from the START! A

year from now, you will be glad.....

I am talking about REAL database managers. I see by the header of your post that you use Windows of some sort. Great. There are many REAL database managers from which to choose, and if you know about them, I will leave it up to you to take a look on your own. In case you don't know, the ones that come to mind right off are PARADOX, APPROACH, FILEPRO, FOXPRO, ORACLE, and ACCESS. I'm sure there are more. All of these are real hairy beasts and are the exact reason WHY people turn to "scanner databases" instead. But there is one more choice worth a long, strong, look!

Microsoft WORKS for Windows! Ver 3.0 for Win 3.1x and Ver 4.0 for Win95. First the cost. It's normally about $79, but I have seen it as low as $49. It's worth it! WORKS has three main modules or programs: word processor, spreadsheet, and a REAL database manager. All three are nice, easy-to-use programs that work one at a time or in parallel with the others. Data is easily swapped from one module to another. Formatting and layout of your data are a piece of cake. Many small businesses run their operations using MS-WORKS for Windows. It is THAT powerful. The word processor in WORKS is a junior version of the immmensely powerful WORD from Microsoft. The spreadsheet seems to be a junior version of EXCEL. But don't let that scare you. WORKS is powerful, but easy to use.

But you are interested in the WORKS database manager for now. It will do all you ask of it and MUCH more. And at all times, your frequency data can be expanded, changed, reformatted, resorted, added to or exported from, and a host of other actions, easily, painlessly, and powerfully. You can hand type data, (Yuck!) or you can get frequency files from the newsgroups, BBS's, archive sites, et al, and with only a little work, drop the entire file right into MS WORKS's database manager.

Not only will MS WORKS enhance your scanning, but it will do a zillion other things you ask of it. There is no sense in spending $25-$50 on a shareware "scanner database" when for $50-$80, you can get MS-WORKS that will help you extract a lot more power from your computer, not only in scanning, but all other areas as well.

I have used MS-WORKS for several years. My main productivity platform consists of MS-WORD, ACCESS, EXCEL, and POWERPOINT, but you know what? I still use the WORKS database manager as a desktop tool and as a front-end (preprocessor) for ACCESS and EXCEL. I even use the spreadsheet in WORKS once in a while.

There are other "integrated" programs out and about....Claris makes one and I think the Lotus people used to. So you can shop around if you like, but the power and the compatibility of Microsoft WORKS is unexcelled for the hobbyist and small business operator.

Strongly recommended you give this some thought before you leap into
something that will tie you down and stifle future growth.

Rgds,

Bill

Steve,

Hope that these will help out some. Primarily TV remote (active during
news broadcasts) and traffic f's.

KSAZ TV Channel 10 -- VHF 161.6700
KTVK TV Channel 3 -- Ch 3 Station 161.7300
KPHO TV Channel 5 -- Ch 2 Station Remote 450.0500
KSAZ TV Channel 10 -- Ch 1 Station 450.0875
KTAR TV Channel 12 -- Ch 1 Station 450.1125
KTVK TV Channel 3 -- Ch 1 Station 450.1875
SKYVIEW -- 2 Way Talk 450.2375
KTVK TV Channel 3 -- Ch 2 Engineering 450.3000
KTVK TV Channel 3 -- News 450.3500
TV Channel 8 -- Station Remote 450.4125
KSAZ TV Channel 10 -- Ch 2 Engineering 450.4500
KNIX Radio -- Traffic Watch Metro Area 450.4875
KOY Radio -- SKYVIEW 450.5875
KTAR TV Channel 12 -- Ch 2 Engineering 450.6125
SKYVIEW -- Traffic Watch Metro Area 450.6375
SKYVIEW -- Traffic Watch Metro Area 450.6875
KPHO TV Channel 5 -- Ch 1 News Remote 450.7500
TV Channel 8 450.9250
KTAR Traffic Ch 1 -- North Metro Area 455.7000
KTAR Traffic Ch 2 -- South Metro Area 455.8000
SKYHIGH -- Traffic Watch Metro Area 857.9125

Also try these web sites for Phoenix area frequencies:

Message-ID: <scottg-0708961945110001@scottg.vip.best.com>
Source record: 227271

I would like to say in advance, "Sorry" for any inconvenience that this message will cause to anyone here in rec.radio.scanner. I have sent many people messages asking them not to contribute to the flame wars and this is an attempt to move the flames to another group. With that said, here it goes.

I have created two new groups in the alt.fan hierarchy, alt.fan.bill.cheek and alt.fan.john.mackey. If you would like to flame either of these two people, please go to the appropriate newsgroup and have fun. If you would like to flame me for creating these groups, please go to my group, alt.fan.scott and have fun. The Followup-To header of this message will automatically get you to my group unless you change it. So, if you post a follow up flame to this message in the rec.radio.scanner newsgroup, I will not respond to it, but please feel free to use the other groups. Also, if you would like to send me a personal email, my address is in the header and signature of this message.

Again, I'm sorry if this causes anyone any further inconvenience here and I hope that we can get back to the scanner posts.

Thanks,
scott

Message-ID: <KAPLAN.96Aug7171707@bog.watson.ibm.com>
Source record: 227277

Pro-60 is on sale now for $250 at Radio Shack. Manufactured by GRE, apparently it is the successor to the popular Pro-43.

Reviewed by George DuBois, see:
http://www.pacifier.com/~ussn/oct/pro-60.htm

Before doing George's "beep mod" - first try reading the instructions! There is a magic keyboard sequence to disable the keyboard beeps from the manual (see: http://www.tandy.com/support/doc15/15354.txt)

"To turn the scanner's key tone on or off, first turn off the scanner. Then while you press and hold 2 and ENTER, turn VOLUME OFF/MAX clockwise until the display appears."

The next step up in the RS line is the Pro-26, made by Uniden, it's a different beast, and (today) it retails for $450. That's $200 more than the Pro-60.

marc.

First,
I X-ed out the last four numbers. "To protect the innocent." <VBG>
As to getting your number, yes 800 and 888 numbers do track the callers
number (caller ID style). This was/is done to for auditing reasons.
The 800 line "owner" pays for each incoming call, and they needed a way
to prove how many calls were coming in. That way around this. Simple.
Public Phones. They are everywhere. Waiting for a meeting, make a call.
Waiting for your plane, make a call. On your way back from the bathroom,
make a call. Now I admit one would have to be obsessed to do it this
way. but the point is, it can be done.

Long live the fight against SPAM !

Uhh..you do realize that rainwater does not meet EPA regulations for discharge into public bodies of water? EPA rules say pH MUST be 6-8. The fact that absorbed carbon dioxide makes it pH 5.5 makes rainwater a violation of EPA regulations.

Also spring floods due to particulates. To say nothing of natural background radiation, mercury, lead, etc., in areas that have that stuff.

Guide to Scanner antennas

by Mike Diaz

There have been many questions regarding how to select an antenna for scanning. This is a Readers Digest version of antennas, meant to give new users some idea of the different antennas and their good and bad points. At the end, I give some specific recommendations on how to build a general purpose VHF/UHF antenna system. This is not an all inclusive book on antennas, but rather a guide for novices in their quest to learn more about their scanning hobby. Whats the best antenna? There would seem to be as many different answers, as there are people asking the question. Everybody has a favorite band that they listen to, and different antennas work better on different frequencies. But the fact is, the general principles remain the same for everybody. The object of an antenna SYSTEM, is to deliver as much signal as possible to the antenna jack on the back of the radio at the frequency youre listening to. Notice I wrote system; the antenna is a system comprised of several parts: the antenna, the lead-in cable, and the mast or tower to hold it up.

1) ANTENNAS
There are MANY different and very good antennas on the market. There are also some bad ones out there. Antennas are where the most compromises must be made. If you have unlimited room , and very deep pockets, you can put up an antenna farm with a different antenna and radio for each band that you listen to, and not have to compromise. But if youre like the rest of us, you WILL compromise. If you only listen to one band, then your best bet is an antenna designed specifically for that band. Something like a 1/4 wave ground plane, or a 1/2 wave dipole antenna is a good choice for omni-directional listening at a low cost. It will have the added benefit of being less efficient out of band, which if you live in a dense signal environment, may attenuate those out-of-band intermod producing signals somewhat.

1/4 WAVE GROUND PLANE antenna
This is a single band vertically polarized antenna that offers about 3dB of gain in a relatively narrow frequency range. Its major benefits are its low cost and small size. The ground plane isolates your antenna from having to be coupled to earth ground at a specific multiple of the wavelength, by simulating ground with the radially mounted elements around the bottom. A car mounted antenna is typically a 1/4 wave that uses the

body of the car for its ground plane. There are some versions that have several vertical elements (like the R.S. Allband with 3) but each vertical element will only be resonant in one band. While it will receive signals in all bands , it will only be efficient in the 3 bands that the vertical elements are cut to resonate at. Radio Shacks all-band (they used to call it a tri-band) is a good antenna if you have a limited number of bands you listen to. Its reasonably priced and gives good performance on 3 popular frequency bands and is usable on the other bands as well, and best of all it is inexpensive.

DISCONE antenna
This is a relative of the 1/4 wave ground plane antenna optimized for wide frequency bandwidth. It offers 0dB of gain, on frequencies from about 120-1300MHz, and with a vertical element on top, it is usable down to about 30MHz. Gain is achieved by compressing the radiation pattern into a donut shape with little of the signal radiating upwards or downwards, concentrating the pattern perpendicular to the vertical axis of the antenna. It's called a discone because it is comprised of two parts, the disc, a group of elements parallel to the ground around the top, and the cone, the diagonal radial elements around the bottom. These could be made from a solid metal disc and a cone shaped sheet metal radial, and perform the same, but the wind loading would be increased. The Diamond D130J and the Sigma SE1300 are good discones for general purpose scanning. My personal experience with the Radio Shack discone antenna at home, has shown that it is not a very good implementation of the discone design, and should be avoided. It is too fragile and does not work below 100MHz. I believe that the discone is the best all band antenna, it really works. I don't see ANY other type of omni-directional antenna usable for TRANSMITTING on ALL VHF and UHF ham bands (50, 144, 220, 432, 900, & 1200 MHz) like the discone is. It would be usable on all frequencies in between too, but that's illegal, if you're transmitting as an amateur. I have built many UHF data and voice links (among other things) for the US Govt over the years and we use discone antennas for the 225-400MHz military UHF band; the VSWR is consistent and low across the entire band.

1/2 WAVE DIPOLE antenna
This is also a single band antenna that offers 2dB of gain in a relatively narrow frequency range. The dipole antenna is the standard against which gain is measured on all antennas, and it is twice as long as a 1/4 wave antenna. It has balanced signal and ground sides, which means that the coax feed is in the center of the antenna. The center conductor is hooked to the top half and the shield connects to the lower half. It requires a balun to connect it to coax cable, although there are feed techniques that can do the job of matching the antenna to the 50 ohm coax. It is fairly large for the frequency it's tuned to, and like the ground plane antenna, it isolates your antenna from having to be coupled to earth ground at a specific multiple of the wavelength, by simulating ground with the lower half of the antenna. The dipole can be oriented either vertically or horizontally.

YAGI beam antenna
Named after it's inventors Mr Yagi and Mr Uda (the second guy always loses out, and I forget their first names), theYagi-Uda parasitic array is another single band antenna. It offers 10-20dB of gain and 10-30dB of front-to-back isolation in a relatively narrow frequency range. It is a group of dipoles all the same length, connected to a boom, to hold them a specific distance apart. It offers excellent gain, and front-to-back isolation, and a narrow beam width that it will receive from. The gain is determined by how many elements are used as directors, and is achieved by limiting how many directions a signal can be received from. Like a magnifying glass focusing the sun, the smaller the spot the hotter it gets. The most useful feature of a beam antenna, is that the can be rotated to null out a signal you do not want or maximizing the one you do want. You will need a rotor to point it in the right direction; if you want to listen in more than one direction. The down side is, it will only have gain in a narrow frequency range of about +/-1% of the center frequency, which would be beneficial in a dense signal environment to attenuate those intermod producing signals you do not want, or if you only listen on one band. It is most commonly used by commercial and amateur operators, since it is an inexpensive and very efficient type of antenna for single band, point to point, communication in the VHF/UHF range.

LOG PERIODIC beam antenna
The Logarithmicly Periodic Dipole Array is a beam antenna optimized for wide frequency bandwidth. It offers 5-15dB of gain with a moderate 10-15dB of front-to back ratio; the beam width is fairly wide when compared to a Yagi. It is a group of dipoles of decreasing size (with the longest in back and the smallest in front), connected to a boom, to hold them a specific distance apart. The tapering of the elements is what gives it the wide frequency range, by always providing an element that resonates near the frequency that your operating on. It is most commonly used in TV antennas, where operation on many frequencies is required. The down side is that the LPDA can be fairly large for a VHF/UHF antenna. There are commercial versions available that provide general coverage. Create Labs makes two models for $200-350. EEB and Ham Radio Outlet both have them in their catalogs.

TV antennas
A TV antenna is NOT a very good scanner antenna because it is optimized only for the TV bands. If you look closely at a TV antenna you will notice that the taper of the elements is not uniform. There will be several long ones (Chan 2-6 at 54-88MHz) then several medium long ones, usually interspersed with the long ones (Chan 7-13 at 175-216MHz), and then a bunch of short ones, all the same length (UHF 470-812MHz). The missing elements are for the frequencies that a scanner user wants, but are not in the TV band, so they are not included in the design. If the frequencies that you do listen to are close to the TV bands, then after re-orienting a TV antenna to vertical polarization, it may work, but I'll bet it doesn't work very well. Another problem is, the UHF elements on a TV antenna are ALWAYS a Yagi design. The reception range that they advertise is only on one channel (my guess is around Chan 35 at 600MHz) and the gain falls off the

farther you get from that center channel. There are no scanner type signals anywhere near this frequency and a Yagi is a tuned frequency antenna. You will NEVER see a gain Vs frequency plot of any TV antenna from the manufacturer. This is why TV antennas make lousy scanner antennas. If you want to use a wide band UHF TV antenna, try a 4-bay bow tie, it has about 6dB of gain, a 15dB front-to-back ratio and resonates across a wide frequency range. The whole antenna just needs to be re-oriented to vertical polarization. On VHF, don't bother. I am not aware of any true broad band LPDA TV antenna, they are always optimized only for TV frequencies, due to the lack of elements resonating in the 88-175MHz and 216-470MHz bands.

2) Lead-in CABLE
It doesn't matter how good your antenna is, if you are feeding it with lossy COAX.
The loss that a COAX has, is determined by many factors, most having to do with the density and effectiveness of the shield and the dielectric (the insulator in the center). If the shield is not very good, more of the signal will be lost before it gets to your radio, and you will be susceptible to multipath distortion in strong signal environments. If the dielectric is made wrong, the impedance of the COAX will vary. The problem is the quality of the cable itself, this is something that you can't see or discern from the specs, RG-8 is RG-8 right? WRONG, because it is a manufacturing process, if the machines that manufacture it are not set-up properly, or the materials used are sub-standard, the result will be BAD COAX. Cheap COAX may have a 98% shield in it's specs but it won't be consistent across the entire length of the cable. Sometimes there will be areas several feet long with large gaps with only a few strands in the shield. There is no way to tell from outside the cable that something is wrong, without using an expensive network analyzer setup. The same for the dielectric, if it's uneven, the characteristic impedance of the COAX will vary tremendously. The result is you just won't hear as many signals at the higher frequencies. That is why you should always buy name brand cable from a reputable manufacturer. There is a reason the cable is cheap.
Frequency is the other MAJOR contributing factor in determining your losses. The higher the frequency, the higher the loss. If you only listen to the California Highway Patrol, in the 39-45MHz band, then a VHF 1/4 wave ground plane antenna and any kind of COAX will do, such as RG58, which is easily routed, and not very expensive. The same is true if you listen only to railroads or police/fire in the 150MHz band. A single band 1/4 or 1/2 wave and the better RG8 cable will be plenty good enough. But if you listen to the 800MHz trunked band you can significantly improve your reception, by just using better COAX. I use Heliax on my system for maximum performance. I've included a chart of some common 50 ohm coax and their loss at different frequencies for comparison.
These are from the Belden Wire and Cable catalog, except for the Heliax.

Losses in dB per 100Ft
50MHz 100MHz 500MHz 900MHz
---------- ---------- ---------- ----------

RG-58A/U 3.3 4.9 13.3 20.0
RG-8/U 1.2 1.8 4.7 6.7
Belden 9913 0.9 1.4 2.9 4.2
1/2" Heliax 0.56 0.83 2.0 2.8

Note: The losses scale proportionally with length. Half as long, half the loss in dB.

3) The MAST or TOWER
There is no substitute for height, until you've cleared the obstructions around your house. After you have cleared any obstructions, more height will give only slightly improved range. Remember line-of-sight won't change much with another 10 or 20 feet of elevation. It takes 1000s or 10000s of feet of elevation to really make a difference.
I don't know much about lightning protection, since here is Silicon valley we rarely ever get any lightning, maybe once every 5 years. I saw some just last winter, or was it the winter before. Anyway don't forget to ground your system as appropriate.

My RECOMENDATIONS
I think most of us listen on many different bands, so a single band antenna just won't cut it. A single antenna, with good performance on all bands is the best solution. I personally have chosen a Diamond D130J discone antenna, and I am very pleased with its performance. The Sigma SE1300 has the same performance but costs a little more. I recommend RG8/U or Belden 9913 low loss COAX as your best bet, the 9913 is much more expensive. I got my Heliax, surplus and cheap. I swept it using an HP network analyzer to be sure it was still good. For a mast, no more than 10-20ft above the roof is necessary to clear most obstructions, such as neighbors houses and trees. More than that will give only a marginal improvement in receiving range and make the installation more difficult and dangerous.

Multiple radios
I've connected all of my radios to one antenna with the use of a 4-way splitter. This is not a cheap R.S. splitter but a commercial quality hybrid type from Mini Circuits with guaranteed specs from 1 to 1000MHz. I lose 7dB of signal but it's worth it to have only one antenna and cable. My ICOM 7100 and both PRO2006s all run from the same antenna and I have an extra spigot that I can use for testing my PRO-43 or any other radio.

If you want more in-depth information, try the ARRL Antenna Handbooks (there's one specifically for VHF/UHF) and check your local library.

Just a guess with the limited information available, but could you
have inadvertantly shorted center conductor to shield anywhere?

Mark

The truth as I perceive it to be.
Your perception will be different.

I'm looking for a program that I can enter all the freqs that I've programmed into each channel of my scanner. I want to be able to print up the list (in a format that can be cut and taped to the top of my scanner). I'd like to be able to enter the freq, channel the freq is stored, and maybe the name of the user of the freq (i.e. Anytown PD), maybe also the list the PL tone that is assoc with the freq.

I remember seeing some sort of a program a couple of years ago, but can't remember the name. Any help will be appreciated. If someone has such or similar program, you may e-mail it to me or tell me a site that I can d/l it from.

Thanks,

Sam

: surface where a person might stand, and you're running no more
: than 1,000 watts ERP (that's your output power minus feedline
: loss and plus antenna gain), you're probably Ok. You'll need to

This is a bit misleading Gary. It should be output power, minus feeline losses, multiplied by the antenna gain. For example, 150 watts out of transmitter, minus 10 watts feedline loss, is 140 watts at the antenna. If the antenna has 10 dB gain, then the ERP would be 140 times 10 or 1400 watts - which is too much.

So much for encouraging better antennas, rather than high power linears. There is now little reason to use an efficient antenna - as the penalty is the same either way. It is much easier to install a linear than a good antenna system.

Of course, you could limit the power under 50 watts, and install a very good antenna. However, I wonder if you would have to have a station that was incapable of greater power output?

I suspect that the new directive is only going to make a bunch of Hams lawbreakers.

>that risk.

That *shouldn't* pose such a problem. Remember the first IBM PC's?
They had software in their BIOS that was copyrighted, but in no time
several companies had "reverse engineered" compatible software that
worked more or less interchangably with the "True Blue" BIOSes.
I don't think IBM (monster that it is), ever tried to sue them.

Of course, the potential microcomputer market was much larger than
the scanner marketplace, but still this shows what *can* be done.

Another "sort-of shady" scenario I have envisoned is one where a company
develops the software (copyright infringing or not) and the hardware for
trunk following, scrambling decryption, whatever and sells THE HARDWARE
ONLY.

So then the hardware is no good right? Well they secretly release
the software to BBSes and FTP sites all over the country (untraceable
to them)... free, but only useful to people that had purchased the hardware
(whose price includes the development costs of the software). With copies
all over the place, the copyright holder would be unable to keep them
from being distributed, and the "cat would be out of the bag."
This would also mean that the scanner (hardware) would pretty much
have to have an RS-232 or similar port (for transferring the software),
which is a feature most of us want anyway.
This is a daring scenario, but possible.

OR>Subject: Re: Scanners on Airplanes

OR>Makes one wonder about airline equipment that is *so* sensitive to
OR>interferrence. I would think it would be better built [shielded] than
OR>that.

They are shielded very well. Anyone who has built stuff to ARINC standards can attest to that. The problem is that the VHF (localizer, VOR) and UHF (glideslope) antennas are in close proximity to the passengers. All those windows are nice apertures to couple signals out of the passenger cabin to the outside...the "slot antenna" effect.

In reality, I've not found any figures of either theoretical studies or model tests or full-scale tests to show that it really IS a hazard. However, consider this: You are sitting in an oversize aluminum can that is travelling around 600 MPH five miles up, driven by a couple of people you've never met before...you've NO knowledge of what is in the cargo compartments or in the carry-on bags of the other passengers. Me, if and when I fly again, will just sit back, pay the earphone charge for the movie, drink the limit of overpriced alcohol, and pray for safe deliverance to the destination.

When you are landing in marginal weather, the approach speed isn't far from stalling, those two strangers up front doing the driving are intently studying the position of the localizer and glideslope needles listening to a PAR controller direct them on VHF comm. Anyone who INSISTs on making RFI under some nebulous, self-interested "freedom" is some idiot you don't want in that aluminum can with you...:)

DCM>From: dmiller@polarnet.com (Dennis C. Miller)
DCM>Subject: portable scanner antenna lengths

DCM>I just ordered a Grove 7"-46" whip antenna for my BC3000XLT. I'm using a
DCM>formula for antenna length as follows:
DCM> 234 ft/freq in MHz times 12(for inches)
DCM>ie. for best antenna length for 155.000 MHz reception:
DCM> 234/155.0 x12 = 18.1 inches

DCM>I don't remember where I got the above formula. Could anybody confirm if
DCM>the above is correct, and if it will work through all the 25-1300 MHz
DCM>ranges? Thanks.

234 divided by length in MHz is a very good approximation for a
quarter wavelength in feet. It includes a 95% velocity of
propagation factor. It's been around since the early 40s but I
don't know who started using it. It's worked for me from 1800 MHz
down to 36 MHz by actual VSWR and network analyzer test. You've got
at least a 2% frequency bandwidth at 150 MHz where only lab equipment
can show the beginnings of VSWR increase.

OK, I would like to purchase a handheld scanner in the near future, and have the following questions:
a) what channels are "musts" What is in the 800MHz region?
b) Are Radio Shack Scanners made by Uniden? They look like it.
c) Any features that are "musts"
d) I know that the newer ones have a cellular lockout, and there is a simple fix, but that isn't important.
e) Any brands or models to avoid?
Thanks in advance!

>If the Grove worked, why not stick with it?

Around here (central North Carolina) the Grove scanner beam is known
to work well electronically, but not to be very sturdy mechanically.
The winter ice and sleet we quite often get (instead of the snow
we would prefer) has destoyed several of them.

Unfortunately, the same thing has happened to TV antennas, but less
often when they are deployed vertically (as for scanner use) than
horizontally (as for TV use).

That is the real appeal of the Create Log-Periodic beams...
they work well electronically and are very sturdily built. Unfortunately,
you pay a premium price for them.

> 1000 ch memory, 20 ch/sec

Its the same as the Trident TR-2400 & Camnis HSC-050 just with a
different badge.

User interface is a little awkward perhaps but does follow similar
patterns used by this manufacturer (also made the AR1000/TR-1200/HP-100,
AR1500 and others).

In terms of value for money it would depend on the cost they are being
sold for.

694. AR8000, AM filter mod

Newsgroup: rec.radio.scanner
Date: 1996-08-07 00:00:00 UTC
From: klimasewski@fccvde.enet.dec.com
Message-ID: <4ua074$7h2@mrnews.mro.dec.com>
Source record: 227315

I have designed a switching scheme that allows the user to select
the stock 12KHz AM filter or the narrow SSB 4.0KHz while still in
the AM mode. I have found this to make a BIG difference when trying
to receive a weak shortwave station next to a very strong one.
The only part required is a switch and some wire.
My mod has no effect on the use of the DS8000 speech inversion accessory.

Send me email if interested.

It might be the manufacturers will have to apply a warning label on equipment to remind the installer / user of the possiable electromagnetic radiation problems of improperly installed equipment.

Kind of like warning label " Danger the coffee in the cup is hot and may cause burns if spilled upon yourself "

We will all learn about the EPA requirements for radio transmission and radiated power. I know manufacturers cannot build a handheld that transmits over 7 watts RF power with out going through MAJOR EPA loops and hoops. No body wants to go through all of what the EPA requires for handheld over 7 watts in power, so they do not build them.

I would guess this might also be a good case for antenna heighth. The higher the radiating element the less signal affects the immediate surrounding area

Ed,

The article on your web site " The following is the text of the FCC 96-396 R/O. Was that straight from the FCC or your interpetation of what the FCC was saying ?

I do not think just not having to file a EIR is a victory or sigh of relif, but the intemt of the FCC to require and make the amateur responsiable for proper knowledge and proper installiation / operation of his equipment . This would include his being resopnsible for not exceeding the EPA guidelines for RF exposure limits.

By mere addition of these questions on a test, you are made aware that the government assumes you know about these limits They would most likely hold the licensee responsible for operation with in the EPA RF Exposure limits. This could turn out to be be a major turning point in Amateur Radio.

Recently in Seattle, Wa area some brought a cellular phone company into court to keep a tower out of the neighborhood, although they group lost, still the legal battle was on. I for one will keep a weary eye to the FCC and EPA about my Amateur Radio operations, also will have another look at my station installiation.

Also....
Ramsey Kits sells a Dr. Ni-Cad Charger.
Ramsey Kits
793 Canning Parkway
Victor, NY 14564
order (800)446-2295
Tech/order info (716)924-4560

The Dr. Ni-Cad charger is based on a Benchmarq Chip and design. I also use that charger. It will 'recondition' ni-cads' by discharging the ni-cads to the (number of cells X 1.00V) level. Upon reaching that level, it switches to a fast charge rate, up to 1.5A. The Benchmarq chip is a negative slope detect I.C. when the battery voltage starts to exceed (number of cells X 1.44V) and the voltage starts to drop, the charger switches to a slow rate pulse trickle charger. This charger will charge 0.65A-H battery packs in about a half hour or so.
Again... the pack doesn't heat up, at all.

I use an Enstore Heart Print Charger module set up to charge at 8Amps.
I charge 2A-H camcorder batteries at a 4*C rate in about 20minutes to
30minutes without the battery temperature changing from room temperature.
Enstore Corporation makes the EnChip and they are located in Austria.
I think they now have a complete charger based on the EnChip and set up
to charge at 4C rates for different battery configurations.

One Uniden Bearcat BC-8500XLT scanner - base unit. 500 channels, each with alphanumeric memory, covers 25-1300 MHz minus roughly 550-760 and cellular (per FCC laws).

Triple conversion, 20 banks of 25 channels each, auto-scan feature can scan a band and store every unique freq. on which a signal is received. VFO knob, direct entry of freq., etc.

Like new condition, with the optional tone decode board. Simply sitting in the bedroom under a towel, keeping it nice and clean.

With box and manual. Asking $275 including UPS shipping to lower 48 states.

Images are created by your scanner. Inside the scanner there is a
little transmitter called the local oscillator that tranmits a fixed
frequency above or below the frequency you are wanting to listening to.
That frequency is called the IF (internal frequency) and is different
for different brands and models of scanner. For my PRO-51 it's
10.8MHz.
The scanner mixes the output of the local oscillator with what it's
receiving via the antenna. When two frequencies mix you get four
frequencies out - the two original ones, the sum, and the difference.
The difference is known - it's the IF - so the rest of the scanner
circuitry can be optimized to demodulate that specific frequency.

Most scanners actually have two internal frequencies - they go through
the frequency mixing process twice to weed out more spurrious signals.
The most expensive scanners have 3 levels of mixing (they are called
"Triple Conversion") and have almost no problems with images.

To calculate where your scanner may generate images you have to know
what your IF is. On the PRO-51 the 1st IF is 10.8MHz and the 2nd IF is
450kHz. You can get this information from the specs section of your
owners manual.

Possible image frequencies are <actual frequency> + or - (2 times 1st
IF).

-Carl

p.s. the 49MHz signals are the cordless phone handsets, not images of
the cordless phone bases (46MHz).

705. Couple quick questions...

Newsgroup: rec.radio.scanner
Date: 1996-08-07 00:00:00 UTC
From: kamst39+@pitt.edu
Message-ID: <4ua5oe$jlt@usenet.srv.cis.pitt.edu>
Source record: 227326

I have an Alinco DJ-580T. It's a dual-band radio, for those of you
who aren't familiar with it. I've noticed that whenever I monitor a UHF
signal that is close to exactly 3 times that of a VHF channel, I get a presence
of a signal on VHF. I'm assuming this has to do with my IF, but can someone
to me, why exactly 3 times? The manual even mentioned something about it,
but just mentioned the situation exists, not what causes it.

My other question relates to CB. Does CB use AM? or FM?

Last question. What's the easiest way to determine if a station is
being repeated or not? Is there a Radio Service code(in use by either
Police Call or various cdrom's) that lets you know its a repeated station? I
found a particular station on 462.1125. I know that this frequency is in
the range designed for Business use base, and the mobile units are suppose
to be on 467.1125, 5mhz up. I've heard activity on both freq's, and both
are registered to the place. But I have not seen the standard signal
present, but quiet noise that often terminates a repeat call. And if they
are not using a repeater, why not just operate simplex on one frequency?
Perhaps a repeater USED to be in place and they just kept the radios.

If anyone can shed some light on the situations, I'd appreciate it.

Thanks
Keith

I have for sale a Pro 2022 with the following features: $150.00

200 channels 10/20

30-54 mhz
108-136 mhz
136-174 hhz
380-512 mhz
806- 960 mhz

I have done a search/scan speed mod by replacing the xtal oscillator and have done the cell mod
for full celluar coverage. I originally posted at 180.00 but will sell for $150.00 (you pay shipping).
I have an owners manual and the original antenna that came with it. Unit is clean but does have a few small scratches under key pad. A great unit for someone looking for a second radio to monitor with or someone just starting out !

Is anyone interested in "trading" ScanStar or Scancat files for their areas with others? Now that I have an AR-8000 and the software, I would be willing to trade the Colorado area frequencies which I have entered.

ntal assessment of your >>Amateur station. Under the new rules, the FCC will add five more >>questions on RF safety to three of the =
written exams. Amateur radio >>operators will be required to certify as part of their license >>application, under an as yet unspeci=
fied mechanism, that
>>they understand the FCC rules on this issue. In some situations, >>certain Amateurs may have to file a complex "Environmental Asse=
ssment" >>better known as an Environmental Impact Report regarding their Amateur >>station operation.

In essence, the FCC is relying on the demonstrated technical ability
and proven self-policing track record and allowing amateurs to perform
their own evaluations. If we determine that our stations are in
comliance with current FCC regulations, we need not file anything with
the FCC. The FCC goes on to say that stations that run less than 50 watts
do not need to perform the self-evaluation but are presumed to be in
compliance.

The VAST majority of amateur stations are already in compliance with
these rules. Those few stations who determine that they are *not* in
compliance are expected to correct the situation or to file the EA as
described in Part 1 of the FCC rules.

The FCC then goes on to say, "We want the licensees of such stations to
provide adequately for RF safety. We do not believe, however, that a
detailed EA or other routine environmental filing is practical or
necessary. . . An EA would be evaluated by the Commission to determine
whether the authorization should be granted in view of the environmental
impact. In reality, this leads to a de facto compliance requirement,
since most applicants and licensees who are not categorically excluded
(see above) undertake measures to ensure compliance before submitting an
application in order to avoid the preparation of a costly and
time-consuming EA. For this reason EAs are rarely filed with the
Commission. This has not changed from the existing rules. "

>This could get real interesting. Since the article says the station >location and all occupants are in a controlled enviroment. T=
hey >consider neighbors and such to be uncontrolled. I wonder what will >happen if a neoghbor comes down with some mysterious illne=
ss like cancer >and notices he has been bombarded with electromagnetic radiation from >your station all these years could he hold th=
e operator liable because >he had knowledge of the EPA guidelines of RF radiation?.

This could happen right now, before these regulations are in place. A few hams have been sued, and a few local regulations were attempted, on these grounds. In those cases, most hams have NOT had an easy way to demonstrate that their station did not exceed the limits specified in recognized standards. Nor did those standards have the force of law. With the new FCC regulations, and the upcoming material being prepared by the FCC, hams will have regulations that limit the amount of energy they can radiate into their neighbors homes (IMHO, with a presumption that anything less than the allowed maximum is presumed to be safe), and, more importantly, a tool that will allow them to demonstrate that they are in compliance with the regulations, using OST Document 65 (being revised to OET Document 65) referenced many times in the Report and Order. I have to suspect that we will be better off this way.

>Also I wonder what the FCC intends to do with all the land mobile >equipment as most all is 100 watts. The article implies a mobil=
e >station operating over 50 watts could also not be in compliance with the >guidelines..

The FCC covered that in paragraph 67:

" 67. Although our exposure criteria will apply to portable and mobile devices in general, at this time routine evaluation for compliance will not be required of devices such as "push-to-talk" portable radios and "push to talk" mobile radios used in taxicabs, business, police and fire vehicles and used by amateur radio operators. These transmitting devices will be excluded from routine evaluation because their duty factors (percentage of time during use when the device is transmitting) are generally low and, for mobile radios, because the antennas are normally mounted on the body of a vehicle which provide some shielding and separation from the user. This significantly reduces the likelihood of human exposure in excess of the RF safety guidelines due to emissions from these transmitters. Duty factors associated with transmitting devices that are not "push-to-talk," such as transportable cellular telephones ("bag" phones) or cellular telephones that use vehicle-mounted antennas, would be generally higher, and we will require that these devices be subject to routine evaluation for compliance with general population/uncontrolled MPE limits. Although we are not requiring routine evaluation of all portable and mobile devices, under Sections 1.1307(c) and 1.1307(d) of the FCC's Rules, 47 CFR 1.1307(c) and (d), the Commission reserves the right to require evaluation for environmental significance of any device (in this case with respect to SAR or compliance with MPE limits)."

Now, back to writing the detailed report that my boss is making me write.
:-)

I will put a big San Diego file on my FTP site later today. It's big, and is best served with a real database manager. The file is called SANDIEGO.ZIP, the contents of which are in ASCII comma-delimited format, eminently suited for dropping into any database manager. My FTP sites are in the sig line below.

I was wondering if anyone has come up with a way to monitor these 800mhz "scrambled" transmissions. the ones i am referring to are not voice scrambled they have delays at the end of the transmission so the scanner wont move to the next channel to hear the response. I would appreciate any advice. the fire dept i am trying to monitor has 4 channels that it scans between but i havent been able to find a way to beat! Does anyone know what the offset would be?? i believe the freq is around 862mhz....thanks...rick

That strongly suggests there is a short in the coax line, probably at
one end or the other where a connector may have been installed
improperly or where a strand of the shield could have been laid over
the center conductor.

You may have to reinstall the connector(s).

Good luck.

Bullshit, you have sent several messages to my ham radio club. We are
all laughing at your whinning.
> making choices for you. You need to make your own choices. And
> suffer the consequences thereof.....
Actually, YOU will be the one to suffer. It doesn't affect me.
> >What I am suggesting is a live & let live policy between us.
>
> Geezus Hortense Kriste, Mackey, what the hell are you talking about?
<<much deleted>>
> Since then, the ratio of your posts to and about me have been 15 or 20
> to one of mine. I don't see where the issue of "live and let live"
> rests on my shoulders, John Boy. So please do explain that apparent
> anomaly.....it is very confusing.....
It's simple. We just stop the bullshit & attacking & insults.
That's all, it is not a difficult concept unless you are only
familar with fighting.

> >Fundamentally, I do respect your knowledge of scanners & for that
> >reason I NEVER attacked you on that topic. Mainly, your attitude
> >& actions are my objection. That is likely something we will not
> >agree on.
>
> Oh well.....hell. Can't win 'em all. But talk about lying? Want me
> to go grab and repost the several of your posts where you DID attack
> me on my knowledge and credentials in scanners and scanning?

Do whatever you want. I know what I have said.

As I said before I do believe you have some good knowledge on scanners.

I also believe you are lying on your degree(s) & FCC license
(credentials).

However, degrees & licenses do not necessarily make a good technician
but do indicate a certain level of knowledge. I disagree on your use
of the term "engineer" as I have the above credentials & even then
still won't use the term for myself, as most of us would not.

I think your problem Bill is that you are a very negative person &
self centered, you believe NO ONE can be as good as you. During the
entire reply from you everything was negative except if it was about
you. Come on now, you should be able to find something positive to say
in any circumstance. In this situation, you could say that I have shown
you ways of doing things that you could not track, such as how I was
able
to find & access SO MANY different anonymous servers. (this is
something
you complained about to my ham radio club)

***** Breaking News Story *****
FCC Ruling Prohibits Unreasonable Restrictions on TV Antennas
by Ham Radio Online, 7 August 1996

In a major ruling, the FCC declared void local laws prohibiting
or restricting the use of small wireless dish antennas.
More significantly, the FCC declared that use of small dish
antennas and television receiving antennas can not be restricted
by "any private covenant, homeowners' association rule or similar
restriction on property within the exclusive use or control of
the antenna user". Under the federal pre-emption, all homeowners
must be allowed to install TV antennas. Longer term this ruling may
have important ramifications for eliminating restrictions on Amateur
Radio antennas.

The complete story is available at Ham Radio Online at:
http://206.13.40.11/
(we are waiting for InterNIC to get our domain name pointed at our new
server).

When are you middle-aged men going to grow up and stop spending your whole lives in front of your keyboards having a newsgroup war??? As for Bill Cheek, I will not buy anymore damn books, and I no longer respect whatever he does or says. As for the newsgroup, it's just hopeless at this point. For now I give up, and i'm removing the subscription. Maybe I'll check back in a few years when these 40 year olds mature... but for now, it's nothing but arguing back and forth and everyone telling everyone else to "stop".. A bunch of babies I tell ya. I rather just ignore the newsgroup and spend my time scanning and talking to real radio people... this has gotten out of hand.

After reading Bills reply, it seems to me that a simple Visual Basic program using the MS Jet Engine is in need. I'm a VB programmer and might be willing to throw a shareware program together. I just Downloaded a demo of ScanCat and I thought it was a bit archaic. If anyone would be interested, just post here or email me and I think I'll be able to put a program together far better than what I've seen in just a couple of weeks in my spare time. What features should it have? What would the menu's look like? What other ideas does anyone have?

Hi all,

I have dug out my old Regency ACT-R-106 10 channel crystal scanner and have decided to put it back in dedicated service for listening to the local railroads around here.

I need to find some new crystals- I am specifically looking for:

160.950 160.245 160.830 160.275 161.520
161.370 161.190 160.920 160.290 160.560
- and possibly -
161.550 160.410 160.470 160.695 161.085
160.545

If you have others in the railroad band I might consider buying them.

It has been several years since I bought crystals. I used to buy in-person from American Crystal in Kansas City Kansas. If they are still in business I would appreciate knowing of the address. Other crystal sources would be appreciated.

Does anyone know the IF of this scanner?

Tennessee frequency tip of the week-

Last time I flew (about a week ago) on USAir, they had no problem with letting me use my scanner radio. They consider it a device in the same class as walkmans, CD players, laptops, video games, etc. The biggest question I got asked was "Is that a phone, sir?". I suspect the black "rubber-ducky" antenna led them (the stewardesses) to believe I was using a cell phone. I politely corrected them, and said it was a radio reciever, not unlike a walkman. The biggest thing is to wait until they say that 'personal electronic devices' can be used. This is usually about 15-20 min. into the flight (before landing or after takeoff), and sometimes they won't tell you when you can use your electronics, so I just asked.

Here is what worked OK for me while in an apt:
Radio Shack sells a length of speaker wire with a RCA jack at one
end, and the other end free. Split the speaker wire from the
free end for a length that approximates 1/4 wavelength of your
favorite freq range. If not sure, split it to a length that is
good for the room size. Stretch each end out along the wall/ceiling
seam. Get a RCA to BNC adapter plug for the other end and you are all set.
Getting the wire as high and as long as you can helps.

I've heard of other people buying discones and setting them on top
of lamp shades, etc. You can do this for about $50.

[...]

Agreed. All it takes it for those involved to simply stop.
They shouldn't have to feel compelled to respond to each
little remark, at least in public. And if they really
can't stand to let the other guy have the last word, they
should go ahead and compose a response until they feel
better and then hit the Cancel button instead of the Post
button.

ALL it takes is not bothering to reply.

Does anyone know off hand if they are using the IEEE C92.1 limits? If so, Anybody trying to transmit at the normal 100W in a residential neighborhood (ie, low wire dipole antenna) may be in trouble. Forget about using attic antennas. The standard penalizes efficient antennas. I also believe the limits vary wiith frequency; I know that that the allowable ERP at 800MHz is only about 0.4W, compared to the previous 7W Max. transmitter power (the old standard did not consider antenna efficiency). I also know that 800MHz products designed well below the 7W transmitter power level usually did not meet the 0.4W ERP or that other parameter, SAR (for products held close to the ear). Yes, our handheld devices may be exempted but my point is that, if FCC is using the 1992 IEEE standard, amateurs in residential areas (a large portion of the ham population) will at the very least be marginal at 100W, if they use wire dipoles, G5RV's, slopers etc., and I believe the small 600W linears will be out of the question. I hate to sound like I'm sounding a false alarm but I'm not ready yet to buy into ARRL's contention (D. Sumner) that the new regulation will show how safe amateur installations really are. I'm sure he has a high tower to take advantage of 1/R**2. The new IEEE limits are much lower than the previous standard, but we will not start seeing this until after we start making the measurements.

Probably to keep the output of the machines relatively clean.

One of the repeaters I use from time to time sits on a hilltop with
a lot of other machines. When it keys up, the RF mixes with all the
other junk up there, and inevitably some of the resulting grundge
winds up on the input frequency. - Now in theory, signals not
accompanied by the correct subaudible tone are not supposed to be
passed through to the transmitter... and the grundge is killed
before it makes its way to the output of the machine. The problem
this machine had was that the grundge resulted from a mix with the
RF coming from its own output, and the PL on that output was kind
enough to hold the gate open for all the other junk that wanted through
(so to speak 8*). Turning off the output PL solved the problem...

CP>seems to me that most of them would cost *more* than a cheap, used
CP>scanner. Evidently you feel (felt) that your way was better than buying
CP>one at that point.

It was designed and thrown together in 1982. Uses two banks of
crystals mixed for the 1st LO to get the civil airways comm band
(118-136 MHz). Not elegant, not graceful, but, at the time, a couple
orders of magnitude better than the Regency manual tuning receiver (a
rehash of an FM BC tube type). While scanners existed back then,
there weren't many of them. The CMOS frequency selection logic was
originally manual (push-button) but a stepping (scanning) system was
added the following year. Note: I'm in line-of-sight to Burbank-
Glendale-Pasadena airport ("Lockheed Air Terminal" in very old days)
and Van Nuys airport (general aviation) and a grazing path to Los
Angeles Intl and Hawthorne; not all that much need for stepping
through a few frequencies on airways comm at this location.

CP> So how is your homebrew rig set up?

On circuit boards inside two chassis (one for RF, the other for logic
and audio and supply). It was put together without regard to
production but the circuit values were carefully calculated and
layout done for minimum internal interference. High-cutoff frequency
bipolar transistors for RF (leftover breadboard parts from work),
CMOS for logic, assorted opamp leftovers for audio, AGC, squelch,
comparators, supply regulation. I think the crystals were ordered
from International Crystal (but it could have been JAN also...?). No
finesse or a system design worthy of production, but it works. :)

CP> BTW... my suggestion for a 'ready-built' is to get a used PRO-43.
CP>I've got one and it's a great scanner... covers almost everything.

OK, thanks! I'll keep that in mind.

Er, have any suggestions on re-cementing chimney stone facing?
(definitely NOT a scanning topic except that the coax skirt dipole
was mounted on a mast attached to the chimney) :)

These frequencies are "trunked" -- Basically several groups share the
frequencies and they have a code so they know when to open squelch.
The other problem you are experiencing is the nasty trunk tone at the
end of the transmission.

There are ways to eliminate the trunk tone, and there are ways being
developed to decode and follow the trunk group code. Both require
additional hardware.

Simply not true. There are plenty of Police, Fire, Medicel, News
stations that still are one channel departments. Case and point i live
in North county Sandiego and all of the comuntiys here are not trunked
with the exception of the city of SanDiego. Anyway you can monitor a
truncked system if you know how.

Sorry to refute

I've since learned that some vehicles have a pump that keeps running
for recirculating the gas from the thank to the engine. (maybe to
prevent vapor lock)

You may be right but I'm not aware of any that will cycle on and off.
If their is a great fuel demand, it would take too long for pressure
to build up again. BTW may now have fuel pumps at the gas tank
instead. Easier to pump then to suck.

I wonder if this guy found the noise problem yet.

What type of cable are you using and how long from one end to another?

Depending on the frequency and type of cable, you could be losing more
then 50% of your signal in only 50 feet of cable. Even though you
are gaining in antenna height your end result may be worse if you are
losing more in the cable length.

50feet of rg-58 cable at 400mhz is about 50% loss if I remember
correctly. This is even worse in higher frequencies.

But what you often gain in height may often overcome the loss in cable
length.

If you are connecting only the center pin and see a better signal
this could be because your whole length of cable is now becoming an
antenna (poor one, but better then the possible loss you may have)
If this is the case then the shield connected only would do even
better.

If you are going to check for short in one of the connecters then
disconnect it from the antenna as well. Some antennas use a balum
(sp?) (transformer) The antenna may look like a DC short but at radio
frequencies it is not.

Cable is so very very important. Most people can not afford the cost
of proper cable, and have never seen what should really be using. In
this case keep the length as short as possible.

Your problem sounds like a cable (feed line) problem.

It is worth pointing out that the FCC standards are from the NCRP and they represent a total exposure over a six minute period. As long as you are running HF sideband (or heaven forbid --even morse) your duty cycle is such that you will not be likely to get a continuous six minute exposure.

Remember that a sideband signal's average power is typically 1/4 of the PEP and that unless you are quite chatty (the FCC thinks we'll transmit and receive 50% of the time) you are unlikely to hit the limits of your exposure at 100 watts. So my Kenwood TS-50 will likely still meet the standards set by the FCC even though I typically run 100 watts. As for how I'm supposed to document this and where I'm supposed to file this report --that has yet to be determined.

: much to build something that could do the trick. Imagine OK City if their
: 800MHz was blasted off the air? Do agencies have any sort of plan for
: this type of attack? Any ECCM in trunked systems?

I can't really speak for other cities, but where I am right
now (El paso, Texas), the police department has kept their allocations
for frequencies in the 400MHZ band, and every once in a while my
scanner will pick up transmissions from "special operations" that the
PD would rather not tie up a trunked channel with. Chances are, if a
situation like that happened here, communications would be cut off for
a while until someone figures it out and starts using the 400MHZ
system again.

And even _if_ that weren't possible, we still have the
Sheriff's department, which has always used 154.960 MHz (and judging
by how "technologically advanced" they are, they'll probably never
LEAVE that channel, either <G>).

769. RCON Receiver Control Software

lately on what they are doing. any one out there who imbibes
near the PAB, add to the info about their plans.....

So far we have Livermore/Pleasanton on trunked, but they are
easy to listen to due to just six channels which they share.

Richmond is ready, but waiting for money. They have their
channels assigned.

Santa Clara County has their channels assigned...waiting for
money. Or for San Fran to install and see how it works

Talk is that Fremont/Hayward/Newark/Union City may combine
on one system 800....after san fran reports back.

there was talk that Contra Costa County Sheriff is interested
and will share with WalnutCreek and Concord PD/fire....but that
was about six months back.

San Mateo County...very interested, but most money they have goes
to Bart Funding into the Airport...so they would have to count on
Fed Funding...which is what San Fran got to get theirs on line.

And about Cellular...you heard it right folks. They use it. A
cop will get to a scene, see that there are four dead bodies in
the lot and will then go back to his car and cellular it in to

PAB....we, the press, never know about it till it's too late to cover....usually after the coroner has gone....

Especially drug dealings....cellular is used all the time. But then too, they have the assistance of the FEDS who usually bring their digital radios and coordinate with their resources. There is a trick to finding out when they are going to make a bust.... but for me to print this leaves me open to the other Press who would then know how I do it.

for each problem there is an answer...eventually.

But scanning is getting difficult to impossible. for most people who don't make money using scanners as I do. It's called: PROGRESS.

771. Re: Newbie Question...

Newsgroup: rec.radio.scanner
Date: 1996-08-08 00:00:00 UTC
From: markl9@aol.com
Message-ID: <4ubtuu$h0t@newsbf02.news.aol.com>
Source record: 227203

a) what channels are "musts" What is in the 800MHz region?

That depends upon what you're into. 800 MHz has a lot of Fire and a lot of business-type stuff like FedEx, etc.

b) Are Radio Shack Scanners made by Uniden? They look like it.

Some are, or have been, made by Uniden. Some by other manufacturers. RS seems to go to wherever they get a "deal". They're current lineup covers about three or four (if I'm off a bit, someone will point it out) different makes.
c) Any features that are "musts"

On the Uniden/Bearcat BC3000XLT, I like being able to have individual selectable delay on each channel; the ability to put the "priority" channel on ANY channel in the bank that I want to, and NOT just channel 1!; selectable attenuation on any channel; and (though unfortunately the BC3000XLT does NOT do this-- ability to use regular AA alkaline or NiCd batteries and not just the manufacturer's sealed pack!

d) I know that the newer ones have a cellular lockout, and there is a simple fix, but that isn't important.

No, it's NOT important IMO, I can't understand the big fuss over being able to listen to cellular, anyway. Yeah, I know that people are saying it's just about the government shouldn't legislate over what you can or cannot listen to that goes out over the air. The cellular lockout will NOT affect listening to the "public service" aspects such as Fire, etc.

e) Any brands or models to avoid?

Any of the Radio Shack scanners except the top of the line models such as Pro 26 or Pro-62. Their upper-end base models are fairly decent.
Unidens are good but stay away from the 8500XLT and go for the 9000XLT. It's a much better radio. If you can find a Radio Shack 2004/5/6 those are very good, but are all discontinued models.

Archers Towing (Chatsworth)
Several towing companys use these frequencies
938.6875R
938.7000R
938.7125R
938.7250R
938.7375R
938.7500R

Black & White Garage (Pacomia)
150.8750

Ross G. Baker (Northridge)
157.5000

Howard Sommers Towing, Inc (Canoga Park/Chatsworth)
*not sure if they do LAPD towing or not
157.4700

According to the LA Sectional ...

Control Tower 135.2
ATIS (WX) 280.4

If you listen to the tower, you should hear them call out the other
frequencies to the pilots.

As of 5 Aug 96, JC Penneys at Atlanta Road and Windy Hill Road, in Smyrna, GA, (which is their closeout store) had about six Bearcat BC120xlt scanners that have been customer-returned and reconditioned. These start at about $49.99, much below the $139-149 that you see them advertised in scanner catalogs. JC Penneys also has a few other Bearcat models that have been reconditioned starting at about $39.99. Over the years I have purchased 4 or 5 from there with great success, and never a problem with the reconditioned problem. They also have some of the same models at slightly higher prices, bnut well below normal retail.

I have the same setup; a Pro-2006 and the $59.00 discone antenna. I have used this for about 3 years have not experienced any problems like you have. I would guess you have a problem with your cable leaking, or something is wrong with your radio. Take it to shack and have them tune it, etc. Or try replacing coax. What's wrong with leaving the atenuater switch on? I use it with my computer on, and have no problem with reception. That's all I can tell you.

Hi Peter:

On the flights that I have been on where the airline made air to ground communications available to passengers, the communications were between the aircraft and the air traffic control. However, there is a separate set of channels set around 130 Mhz that are the "company" channels used for private communication between pilots and company ground support. This includes all kinds of discussions involving mechanical problems, sick passengers, whether scheduled connections can still be made due to late schedule, and a whole host of things that I suspect that the airlines would prefer that the customers not hear. This is the channel that I believe they do not want the passengers to be monitoring. I have never heard this channel made available on the passenger audio system.

Best wishes,
Raymond Makul

787. Antenna recomendations, stupidity, and Cheek

Newsgroup: rec.radio.scanner
Date: 1996-08-08 00:00:00 UTC
From: mtwomey@clc.cc.il.us
Message-ID: <4ud02h$1ut@news.clc.cc.il.us>
Source record: 227219

O.K. First I recently bought a used Pro2005. I live in an apartment so I am limited on what type of antennas I can use. I would like a decent antenna for more or less $100. Could anyone recommend something?

Second I MUST say I've been reading this news group for over a year now, and I have NEVER seem so much stupidity on any newsgroup before. I mean this big fight. You know how when you start an argument and then it grows larger you start making threats and start to lie about things... Then you start bullshitting about stuff you reeeeeeeally don't know about..

My GOD! Have I seen some stupid shit! I've seen:

- People making DUMB (false) stories about Bill

- People "Threatening" to email bomb Bill (Oh no!!!!! a fate worse than death??) It's not that big a deal people.

- Bill pretending he doesn't care at all... (Yeah right it's not that big a deal but it's STILL anoying to have to delete stuff or set up filters or what not...)

- Bill Re-posting another user's posts from alt.depresion (VERY low blow. I can't think of a lower thing a person could do on usenet... you'd make a good politician Bill..)

- A stupid person threatening to send a bomb in the mail to Bill...(not a smart thing to do)

- The stupid person above is actually BEYOND stupidity!!! Don't try that shit when you don't really know much about nntp. Your information was in the headers... We don't even have to investigate to know who you are..

- Bill thinking that ISPs Really give THAT much of a shit about his personal problems. (I can tell you, I'm the postmaster at a college and unless something is directly affecting the preformance of my email system I could care less... and 50 emails a day isn't shit.)

- People saying Bill doesn't know shit.. (come on people he know what's up with scanners...!)

- Bill pretending he's an expert in lots of other areas he's not. He we all know you know your shit when it somes to scanners, but lets not pretend that makes you an all powerful overly qualified bonified genius in all areas of life!

Well although I'd rather talk about scanners... I must admit this argument is not to annoying to me because It's kinda fun to watch.

P.S. add me to your kill file whoever that hell it was that is always adding everyone to his kill file... You've contributed more CRAP to this group than anyone by replying to whole messages and just tacking "Congrats! You've been added to my kill file" onto the end.

It sounds like the FM station is overloading the front end of your scanner. You may try looking at an FM trap. Check the loss above and below the FM band and pick the best one.
You just have too much signal and it is wiping out a wide range...

Ben

Jay,
This could be there way of telling the officer to check his MDT for the information. Many of the local communities now use the MDT's for sensitive information like name and phone numbers. Some places it is even against department regulations to put out this kind of information over the air. You might try 155.745, this is the Scott county sheriff F-2 information channel. Maybe this is the one they are talking about. I have a large database of frequencies for Minneapolis St.Paul and surrounding area, if you want it e-mail me and I'll e-mail you a copy.

> squelch circuit.

The addition of your discone and high grade coax has overloaded your
receiver with the RF from the kilowatts from 105.9. You should look
into a FM (88-108) filter. It may attenuate some outside the FM band
but you have so much gain now anyway that it shouldn't be a problem.

Buy an older scanner....

> Unless you live in a small market where the cops don't have the money to
> use trunking; scanning is going to get more borning.

See above... Besides, even in large markets, not everyone is going trunked. My favorite agency to listen to is the Arizona DPS. Anyone know if they ever plan to go trunked? Somehow, I doubt it (I do not claim to be an expert, however) as they need statewide radio capabilities in all of their portable units... (Can a trunked system handle that?)

If it's your opinion that "Dispatch" confuses your Dispatchers, do you
get to eat very often ? Have you noticed that you seem to get more than
your share of the long drawn out offense reports ? Do you seem to be
the one always held over for that one screwy call that comes in just
before shift change ?

Perhaps a better attitute toward the Dispatchers who can vector in the
guys that save your butt one day would change that.

Big dog, huh?

798. LTR Trunking Technical Questions

Newsgroup: rec.radio.scanner
Date: 1996-08-08 00:00:00 UTC
From: Joseph.Cardani@mail.tju.edu
Message-ID: <4udc88$2g0@mail.TJU.EDU>
Source record: 227230

If anyone is familiar with The EF Johnson Type L (LTR) trunking system, I would like to know the following:

1. What does the "USER" represent in the system. Is it the radio's unique ID or is it a Group of users (eq, Fire Department).

2. What is the HOME REPEATER and how does it relate to the users above?

3. What is the HANDOFF information that is resident in the subaudible info? Is this info only transmitted (in subaudible) on the HOME reeater or on all voice channels?

I am considering purchasing an LT-2 trunking decoder and this info would be helpful with understanding this system.

Thanks,

Joe

>more or less $100. Could anyone recommend something?

Do you have access to the roof or a crawl space in the attic? What
kind of space DO you have available? THAT makes all the difference in
the world.

An Off-Center-Fed-Dipole (OCFD) is cheap and easy to make - nothing
technical, really. If made of wire, it can be taped to a window,
wall, or sliding glass door. If made of aluminum tubing, it can be
leaned in a corner.

A magnet-mount antenna glummed onto the refrigerator works ok. For
that matter, a small VHF-UHF-FM TV antenna mounted to a broomstick and
leaned against a wall can do wonders.

>My GOD! Have I seen some stupid shit! I've seen:

>- People making DUMB (false) stories about Bill

If only they'd make 'em funny, it would be ok. I like to laugh, and
it doesn't matter whether I laugh at THEM or me.

>- People "Threatening" to email bomb Bill (Oh no!!!!! a fate worse than
> death??) It's not that big a deal people.

Ri--ght. Not really......

>- Bill pretending he doesn't care at all... (Yeah right it's not that big a
> deal but it's STILL anoying to have to delete stuff or set up filters or
> what not...)

Yes, THAT is annoying, because it forces a break in the daily flow.
But once the filters and kill scripts are set up, then it becomes
orgasmic. Like, Hugh Duff is operating totally anonymously now, and
this morning he tried to load my mail box with 2-Mb of junk. The
front end got 'im! So it's annoying only once.............

>- Bill Re-posting another user's posts from alt.depresion (VERY low
> blow. I can't think of a lower thing a person could do on usenet... you'd
> make a good politician Bill..)

That wasn't so low considering the level and intensity of the attacks
on me, BUT......in retrospect, I regret it....for reasons not
appropriate to discuss here.

Politics? That ain't fer me. What politician deals in truth and fact?

>- A stupid person threatening to send a bomb in the mail to Bill...(not a
> smart thing to do)

We're still looking into that one..... :-)

>- Bill thinking that ISPs Really give THAT much of a shit about his personal
>problems. (I can tell you, I'm the postmaster at a college and unless
>something is directly affecting the preformance of my email system I could
>care less... and 50 emails a day isn't shit.)

It isn't a matter of thinking. You're right, some ISP's....maybe
most... don't give a hoot about the small stuff. Some do. I have
encountered BOTH these past three weeks.

>- People saying Bill doesn't know shit.. (come on people he know what's up
> with scanners...!)

That is a thing shrinks call "projection".....a common malady. Those
who don't know beans "project" their image into others.

>- Bill pretending he's an expert in lots of other areas he's not. He we all
>know you know your shit when it somes to scanners, but lets not pretend that
>makes you an all powerful overly qualified bonified genius in all areas of
>life!

Where do I pretend? And what is this "expert" business? If we are
talking absolutes, then Radio and Telecommunications Systems
Engineering and Technology and the English language are areas of my
expertise. If we are talking relatively, then there are a number of
other areas that my path has crossed to some depth; including chemical
engineering; meteorological engineering; air pollution metrology and
engineering; electronic calibration and metrology; computers and
computer operations; information acquisition, processing, storage, and
retrieval; mathematics; psychology; world history; geology; space;
minerology; aqualogy; accounting & bookkeeping; business
administration; corporate management; contracts administration &
negotiation; physics; energy; probability & statistics; poker, chess,
Pinochle, craps, Twenty-One, and other games of chance/skill;
and.......peeing contests.

Scanners? Oh geezus.......scanners are a teeny-weenie little sideline
of what I do and have done. And I mean fractional. But THAT is all
you are aware of in terms of what I do. You ought not to infer that
scanners are the only thing I know. It was a quirk of fate that made
me jump into scanners. Besides, scanners are only receivers.

>Well although I'd rather talk about scanners... I must admit this argument is
>not to annoying to me because It's kinda fun to watch.

Of course it is! And for some, it's fun in which to participate, too.

I really can't claim the latter as a preference, but unlike many
experts and front-running personalities, I don't run from conflicts.

If someone wants to potshoot at me in hopes of grabbing a ride on my wave, that's cool. But I shoot back. It's THAT or let the cacophony of the vociferous minority run me off.....like they run off others.

The harsh, cold, brass-tacks facts are that very few prominent people, business leaders, and subject-matter-experts of any repute bother to populate and participate in these public forums.

Sooner or later, they come under attack where to fight is "bad for business"; to run is "bad for business"; and to ignore poignant, pregnant, loaded questions from the attackers is "bad for business". It is seen as a "no-win" situation by many leaders of their fields to be available in public. I'm different.

Business comes second. It's there, all right, and is an inseparable part of me. You get Hobby Bill and Business Bill all wrapped into one package. As to whether I am a "leader" or "prominent personality", well......that's in the eye of the beholder. I do not have the time to sit around basking in the glow of any warm fuzzies that might come from knowing a little something about something.

But I do have a lot to offer the community....to those who want it.

It's just that there's this vociferous minority who don't want it, and who are pretending to speak FOR the the whole community. You will note how I question the use of words like, "we", "us", "our", etc, when some snotball jumps my case. If he wants to speak for himself, that's fine. I'll listen. If he tries to speak for the community, I'll pop 'im up side the chops, figuratively speaking.

The squeaking wheels have no right to intrude on the space of the silent majority, and THAT's who I am here to serve.....those who WANT what I have to offer. Those who don't want it certainly need not be forced to take it. But they act like I intrude on their space by posting here. (And then get huffy when I tell 'em to eat my shorts.)

But anyway.......evaluate your space situation in your apartment and maybe we can come up with some sort of an antenna to do a decent job of grabbing the more interesting signals.

800. Need opinions for a new scanner

Newsgroup: rec.radio.scanner
Date: 1996-08-08 00:00:00 UTC
From: bob@cowboy.net
Message-ID: <4ud9ub$ht4@ns.cowboy.net>
Source record: 227232

Hello All,

I am in the process of considering what brand of scanner I might want to buy soon, but I don't have a lot of information on current models. I thought it might be productive to pose this question in this group. I value opinions of people who have owned and had success with a particular model... One could look at ads and specs all day, but not really get an idea as to how other consumers feel about their radios. A salesman will tell you anything to get you to crack open your wallet!

I would be looking for something in a hand-held model. Of course, wide coverage is a must and I wouldn't want too many gaps in coverage. We don't need to discuss those two areas between 800 and 900 MHz, though. Automode detection would be nice.

These are the important things. I guess thousands of memory channels might be useful for some, but might be overkill in my situation.

If anybody could make suggestions about what they like and might buy in the future, I'd really appreciate it.

Thanks.

Bobby Irvin

>So far I'm alittle disappointed with the Scout, but I love the AR8000.
>Jurys still out though on the Scout though, maybe if I could filter out
>all of the 900 Mhz and above.

I would highly recommend the use of a minicircuit filter

& I would also recommend the use of a tuned antenna.

The combination of the opto 800 pass filter and 800 antenna is incredible !
only gets the 800 stuff.

When I would put on different antennae the display would flicker around the
freqs that the antenna was tuned for. ie a 400 Mhz antenna would flicker around 390-460

My 800 antenna would go between 750 850.

I hear "Death of Scanning; News at 10:00" and I wonder why.

It makes me think of what people must have thought back in the time of Marconi and Telsa -- Oh my! Messages are being sent *through the air!*

If anything is dying, it is the death of the "scanning spirit." Just as the advent of radio kindled the imagination and creative spirit of those who tinkered away at finding ways to listen to radio, CW, AMTOR, PACTOR, WESAT, etc., we'll find a way to "listen" to the new digital RF communications. There are plenty of people working on all sorts of interesting projects -- Don't moan about the death of scanning. Be part of the new aspects of the hobby.

Now, I climb off my soapbox. :)

...a 1000 watt transmitter would be easy to locate.....on the other hand once the portables (since the base doesn't receive it's transmitted data channels) loose the data channel they would not respond properly. The Base would then try alternate data channels until it successfully established communication again. This is assuming the trunked system was the usual "clone" Cellphone system and not the Motorola "non-data channel" type. Once the mobiles scan for a primary and alternate data channel they are back in business. You'd have a hard time jammin' all the mobiles and the base could compute the source location from the lack of mobile responses in that area. In a well established multi tower system the software is inherently designed to track and control the transmit power of the mobile units to prevent interference and conserve mobile battery use. It would be easy to locate a "dead" zone caused by, among other things, a 1KW transmitter.....on the other hand a 1 khz tone from a 5 watt transmitter operating on any of the base station receive frequencies would spice up the airwaves a bit...but then again if it was a multi cell site it would be real easy to triangulate the source and use signal strength between the receivers to place your location within a few hundred feet.....hhhmmmmm????

: I make and sell a DTMF decoder that you might be interested in. It
: has a 16x2 line LCD display, has 511 number non-volatile memory, RS232
: output, a cable to attach the RS232 port to your PC, up/down scroll
: buttons and is powered by a 9 volt battery. Tone's identity are sent
: out the RS232 port as they are decoded, and/or you can dump the memory
: contents to the RS232 port at the push of a button. Pauses greater
: than 5 seconds cause a delimiter character to be inserted on the
: display. You add a case.
: Audio can be made via pigtails to your scanner's audio jack or
: speaker.

Does this decode all 16 DTMF tones or just the standard 12 as found on a telephone ? Most people don't know that the original DTMF keypad had 16 tones. It has an additional row down the right side of A, B, C, D. The * was E and the # was F. Look fimilar? Hexidecimal... :) Amatuer radio uses the full keypad so unless this decodes all 16 it wouldn't be very helpful. Wouldn't matter for decoding plain phone numbers but would not be able to handle command codes.

A friend of mine came across a little device and I would like some info
on it please. Heres the discription.
It has a chip on it. It says (699E 0141att3) it is an 8 pin chip
on the board it says (68-mtu attraci usa)
the whole thing was coated in a silicon type of caulk. (Potting)
any info would be welcome. I think it is some type of phone bug cause it
has a red and green wire going in and out of it. These were found in the
CA area. Thats all I know. Thanks.

>>Sorry to say this.

I sure hope this is not the case. It isn't for me. There are certainly
a lot of changes going on. Some good and some bad. I think one of the
magazines recently did a spot on this subject (haven't kept up on my
reading lately) I guess it means that those in the hobby need to adapt
to those changes and kind of "go with the flow". My interpretation of
this is that we explore and find new and different things to do with
the hobby. One of the best things about living at this time is that
things are changing so rapidly (off topic, but an example is home PC
units. A few years ago 1.2 gig hard drives and 16 meg ram were out
of the question, now they are the norm) so with the changes, search out
the new, the unique and the exciting. It will be there for those who
seek it. (I agree with the trunking issue making it more difficult to
deal with. as yet, my interests haven't been modernized to make the
trunking issue germane to me. I do hope, however, that I'll be able to
still subscribe to my thoughts above when it does.) :-)

>and phenomena. 50% is -3 dB or about a half S-unit. When you patch
>one antenna through a splitted to two receivers, you lose 50%. An SWR
>of 3:1 causes only a 25% loss.

I think you would lose more then 50% after dividing the signal. It
not only is the signal split in two but the loss due to mismatching
the feed line due to the change in impedance. Unless it is done
correctly, but still even in a balum there is "some" loss.

As for S-Units being 6 db/unit (you said 3db is about 1/2 s-unit)
I would have to disagree with you here. Aside from maybe CB radios
I'm not aware of any other reliever that has such a scale. That is
3db=1/2 unit, Any examples?

Many scales I'm used to using are in fact using the Decibel system not
S-Units, perhaps there are cheeper units that will use some inaccurate
scale I don't think I would use it to measure or compare line loss, or
antenna gain by this.

An RF micro volt meter or Service Monitor would be a better choice if
one wanted to make such a comparison. (not everyone can afford one!)

I would only use these 's-meters' for relative measurements but that's
about it. Again they must say what a S-Unit is.

Correct me if I am wrong but a S-Unit is not a unit of measurement
Bill.

>>But what you often gain in height may often overcome the loss in cable
>>length.
>
>Rule of thumb is an additional 3 dB of signal for every 10-ft increase
>in height.
>

This is incorrect. While you may gain in height you can not say or show that it is 3db for every 10 feet. We are talking about ground signals here. If you are not in line of sight then yes your will gain. If you are in line of sight then hight will only serve to increase the distance between your antenna and the radiated signals pattern. It depends on the propagation of the transmitted signal.

Microwaves, Cellular phones etc. are very much line of sight. And ground waves. Its like a car headlight. If you are even 10 feet in the air it will make a difference, you will not have the light shine in your face. The only time hight will make a difference is when you are helping to overcome some line of sight obstacle.

Look at Cellular phones, pagers, trunked radio system with voted receivers etc. They point their signals down off tall structures. You can live in an apartment building with a pager transmitter across the street and not be bothered by the signal but as soon as you are at ground level your blasted by RF.

This is why I disagree with your 3db/10feet rule.

And using 3/4" heliax is only 3db loss (close to it) as compared to your rg-58 12db loss at 100 feet (400mhz) Compare this feed line at a few dollars per foot to a few cents for foot of cheeper cable.

I've used Heliax and had some great success.

BTW the CN tower if you ever get a chance to check out the radio rooms full of transmitters/receivers you'll see some cables the size of water hydrants! a foot in diameter or more.

835. JON VAN ALLEN, KF7YN, IN SALT LAKE CITY HAS REDEEMED HIMSELF

Newsgroup: rec.radio.scanner
Date: 1996-08-09 00:00:00 UTC
From: clarke@aztec.asu.edu
Message-ID: <4ugge8$t61@news.asu.edu>
Source record: 227053

Just to summarize this situation, last Feb. 28th, Jon posted
a message that he would buy old Bearcat scanners (working or not).
I responded and he said he could only offer $20 each (sight unseen).
After a couple of e-mails, we decided that I should send them for
his evaluation as I felt they were worth more than that. I sent
them UPS on Apr 18th. After requesting my money each month for
3 months, I finally resorted to posting on this newsgroup to
beware of him.

He wrote me e-mail within a couple of days and said he had just
gotten back from a trip at sea and had just plain forgotten to
send me a check. He apologized both privately and publicly.
I think it was an honest mistake on his part. I also think I
waited a quite reasonable amount of time before getting nasty.
I think we should just chalk it up to circumstances.

I'm not going to wait until the check clears. It would not be
fair of me to drag it out any longer before posting this message.

So everybody please erase from your minds any bad thoughts about
Jon Van Allen.

By the way, the check was for $40.

73,

Jack VE3EED/W7

> Now, I climb off my soapbox. :)

Yeah, well three-holers, Rears & Sawbuck Catalogs, and corncobs are gone, too.

What will do you do when there is nothing to monitor? Listen to NOAA and ATIS, maybe? McDuck's Hamburger Slingers?

That's all well and good to clamor for a rise to the next challenge, and many of us are trying to do just that. But what do you do when the only challenges left are illegal to mount?

That's all well and good to 'find a way to listen to the new digital RF communications', except that it's illegal in most instances, or will be. The ECPA of 1986 gets down and dirty on signals "not intended for public reception". It only gets worse from there.

DES/DVP encryption and spread spectrum are unbreakable by the hobbyist. You can't receive a satellite uplink if you're not in the path....and the downlink may be encrypted.

I don't see the "scanning spirit" being a problem at all. The problem is a combination of government and technology. Tecchnology affords most radio environments the capacity to guarantee privacy now, and where it doesn't, the government dictates it.

Scanners and world band receivers are not "continuous" tuning anymore, and can't be retrofitted so. This turns off a huge crowd of wannabe scannists. Matters of law turn off even more. The limited selection of McDuck's Hamburgers and Checker's Pizza Delivery signals is another turn-off.

Your call to rise to the challenge is fine and all, and I'm no "legal" goody-two-shoe - I am just saying that law and technology conspire to make your call a bit hollow and pipe-dreamish. Our focus ought to be on getting government out of our hair. Then your call might have a bit of relevance for the next 5-10 years or so.

As it is, government is hell bent to deprive you of your right to defend yourself; to locomote yourself, family and possessions; and to communicate.

But you can't stop technology. And sooner or later, McDuck's Hamburgers will spend the $50 or so to encrypt their drive-up ordering system. Cellular will be digital. Land mobile will either be spread spectrum, encrypted, or cellular-based. And the government will have our guns and radios and ID transmitters in our cars.

Then what?

Cowboy Bob asked: What handheld scanner should I buy?

I'v had several in that past couple of years and they are all good! Seriously, you didn't say how much you wanted to spend. If you're willing to go for $400, get the BC3000XLT (or the UBC3000XLT European no-gap version); if you're willing to go for $600, get an AOR8000.

Rather than go in to the nits and grits of each here, get yourself to Javiation (www.demon.co.uk/javiation) web sites and look over the tech-specs.

I keep wondering why everyone puts down FLEX so much.
It is true that FLEX is capable of a higher data rate then POCSAG.
However it should be noted that FLEX is better in weak signal
conditions. Many carriers in the US are using 2400 baud POCSAG, a FLEX
signal at 3200 baud is more reliable then the 2400 baud POCSAG page.
I do personally still prefer POCSAG 512 on VHF though.
I should also mention that many carriers in the US do not know how to
properly setup a FLEX system, there are a ton of system considerations
and it does require more time and dollars to set up properly. With a
properly designed FLEX system not only will you get reliable pages,
but your pager battery will last a lot longer then a similar POCSAG
pager.

839. Scantenna or Discone?

Newsgroup: rec.radio.scanner
Date: 1996-08-09 00:00:00 UTC
From: malex007@aol.com
Message-ID: <4ugcvf$oa1@newsbf02.news.aol.com>
Source record: 227057

Has any one tried Grove's Scantenna alongside a discone, like Radio Shack's or Nevada or something along those lines?

I've used the Scantenna for a couple of years and like it a lot, at least I did until I moved a couple of miles down the road last year. Now, I thinking I might be able to reach out a grab a few more freqs and pondering whether a discone might be an improvement. I don't want to a beam antenna (too lazy to fuss with a rotator).

Send me some info about modifying the BC200XLT too. I attempted to modify mine with info collected from an ftp site, so it would accept cellular freqs. But it was garbage info, now it has to be sent off to be repaired!

Any info (that works) about altering the BC200XLT would be greatly appreciated!!!!!

Thanks ahead of time!!!

Well, if you're talking about the connector in the battery compartment, that
is a 7 pin connector. This interface does not use this connector.

> 51

The 51's cheaper not only because it's only double conversion, but because
it covers a much less freq bands. The 60 covers everything from 30-999mhz
with no breaks in between, except cell, of course, and will sound a little
bit better. You're not going to get that solid chunk of freqs from a 51.

I don't know the frequency, but you probably can still get crystals through your local Radio Shack. I just did a couple months ago. Cheap ($5) and fast service. The store should have a catalog which lists the scanners and their IF along with frequencies available.
>
> I also have 39.42, 39.88, 42.66, 42.88, 45.74, 45.82, 45.98, 153.755, 154.31, 453.400, 460.375.

How about $3/each if you want them. These work with 10.7 mhz IF.

> >this a good way to monitor cell calls?

To find where an image will lie, take twice your first IF frequency,
double it, and add it to/subtract it from 870 MHZ. One of these results
will be the image frequency of cellular. Scan upwards from there.

>Regards, Ray Miller N2NJK

Trunking gets a lot of focus, but it is hardly THE issue that
highlights the dark side of scanning. A trunked system can be
followed with a little practice and wherewithal.

It is not likely to ever be automated for the scannist simply because
the data stream (format and content) that runs a trunked system is
proprietary, copyrighted, and illegal as hell to utilize unless
authorized by the owner. So the manual methods will have to do.

There is an expensive, albeit illegal, black market in trunked
following, though. I mean, you can buy a radio of the type used in a
trunked system and have it programmed (illegally) for that system.
Some people are doing it. But they can't talk about it, and can't
participate with others who do it. The notion will never catch on
like linears and freeband did for Citizens Band.

The main problem with scanning will eventually be NOTHING to monitor.
Many land-mobile applications are moving over to other technologies,
including cellular and cellular-like systems. Even those who aren't,
are going digital, encrypted, spread-spectrum, satellite, wireline or
exploring other options that lets the scannist out of the picture.

Plainly stated, narrow-band FM is inefficient and costly. Hell, the cellular service alone renders obsolete many land mobile applications. Cell phones are free or cheap and the service costs only in proportion to useage. Commercial land mobile users pay a lot for maintenance, hardware, and monthly service contracts, including repeater.

Ironically, a combination of the PC and radio may well be the last frontier in the climax of radio's "hundred year waltz", and it may well be something we just have to accept.

To me it sounds like DVPA, which is Domestic Violence, Persons Acquainted. This is a mandatory arrest in the State of Washington.

I once had a friend (used to be a friend) who was arguing with his younger brother over the older brothers girlfriend. The younger brother called and hung up on 911 (Woodinville)as a joke, but the officers responded and arrested the older brother under the law. Once 911 is called and the dispatcher determines something is wrong, the officers usually must arrest the the "hitter."

If this isn't what you are hearing, if an SPD LINCOLN 90 unit is responding, it is usually a drunk down in downtown Seattle.

****

He's right. What I do is program that channel to something like 123.456
(which will change to 123.455), then lock it out. Remember that freq.
as being a blank channel and when you go to program another freq. in
it's place, you'll recognize it as being a blank channel.

> effort and scrambling is also becoming more and more.

The Cops are not the only thing to listen to. I listen to them on ocasion but mostly I listen to the odd-ball stuff. I like the local utilities, local landfills, security guards, railroads, aircrafts, marine and I really enjoy being in the know at a very large road race course. I know about wrecks, bumps, passes, spins,and everything else they don't cover on the TV or PA system.

> The prices of scanners also are going out of site very rapidly.

What is wrong with the scanners you already have? I have an old Pro-34 that is the best scanner I ever bought (the second one I ever bought). I haven't modified it at all. I wouldn't trade it for an AOR8000, it still works great. I also Have an AOR1000, the only time I bring it out is at Indy car races, I like being able to program the scanner by car number (so car 23 gets channels 023, 123, 223,323, etc...). Other wise the most expensive scanner I own would never get used. I also have a Pro-2006 also unmodifief, I use at home. None of these are very new, and other than the AOR they were bought on layaway so they didn't break the bank.

> Unless you live in a small market where the cops don't have the money to
> use trunking; scanning is going to get more borning.

If what you curently listen to dries up there is an entire spectrum of signals out there find some new ones. I just wish I lived close enough to a Fast food joint to be able to hear one of them once (guess I'll have to go buy a Big Mac and sit in the parking lot with the Pro-34 to hear them)

> Sorry to say this.

There is alot of info on the main page, also check out the track
frequency pages there is one for Road America. I used this site when
we went to the US 500 in May and didn't miss a thing.

I used to pay for this info now I get it for free. I love the net.

I've got some frequencies on my Federal/Military Frequency Page, but it's not too terribly inclusive. You might want to try the SCAN-L mailing list for more info - mil air freqs are passed around on quite a regular basis.

Oh, yeah, the URL for the page is:

http://www.zianet.com/kc5kto/fedfreqs/fed.html.

Just received in the mail - announcement of "Battery/Fuel Cell Technology - Update '96 (Which Battery/Fuel Cell Do I Choose for My Application)", November 6-8, 1996, University Center for Continuing Education, Milwaukee, WI (Univ. of Wisconsin at Milwaukee). Call 1-800-638-1828 to reserve your place now!

For a mere $990 course fee (!), everyone attending can get 1.8 CEUs and the real skinny on the latest/greatest battery stuff, including "What makes a cell tick?," the first session by Dr. Frank Ludwig, sub-headlined as "the minimum science you need to know."

Tick...tick...tick...

THERE! That will settle everything for all concerned! :)

Boy, you are going to get alot of opinions with this question!

Most of the major carriers are now using the newer 900 Mhz frequencies and they claim the signal penetrates buildings, better than the older VHF and UHF frequencies. This is true. However, if you don't have enough transmitters in your area, the signal won't be received.

The older VHF frequencies (152 Mhz) may not penetrate a building as well as the 900 Mhz, but the signal travels much further than the 900 Mhz frequency; not as many transmitters are needed.

If you are going to be in a major city, in and out of buildings, I would perfer a 900 Mhz pager. If you plan to be in the suburbs or rural areas, I would buy a VHF (152 Mhz) pager, if available.

Aside from the frequency, another factor (that you may not have any control over) is the baud rate at which the pager will be receiving the signal. Some believe the higher the baud rate, the more problems your pager may have receiving the signal. The transmitters must be tuned/timed precisely to avoid "errors" and alphanumeric "brackets." (This is *only* an opinion of many users.)

In my case, give a VHF (152 Mhz) with a 512 baud rate and I'm happy as I can be!

=KEN=

Ian, did I answer that right? Should I have mentioned "FLEX?"

RM>Subject: Re: Scanners on Airplanes

RM>On the flights that I have been on where the airline made air to
RM>ground communications available to passengers, the communications were
RM>between the aircraft and the air traffic control. However, there is a
RM>separate set of channels set around 130 Mhz that are the "company"
RM>channels used for private communication between pilots and company
RM>ground support. This includes all kinds of discussions involving
RM>mechanical problems, sick passengers, whether scheduled connections
RM>can still be made due to late schedule, and a whole host of things
RM>that I suspect that the airlines would prefer that the customers not
RM>hear. This is the channel that I believe they do not want the
RM>passengers to be monitoring. I have never heard this channel made
RM>available on the passenger audio system.

This is rather broad _speculation_ based on nothing much. Company
frequencies are not encrypted, are the same AM as other frequencies,
are in the clear insofar as ANY receiver are concerned. I've not
heard any of those "whole host of things" listening on the ground.
I don't fly much and had only one opportunity to hear airways comm in
the cabin but never switched to it. Cabin seats don't have the
double-knobed channel selector (MHz and 25 KHz increments) that the
pilots have and why should they? Why add to cabin wiring complexity
just to satisfy a tiny, tiny fraction of the passenger manifest that
has an urge to hear "secret" comm?

Relax, have a drinkie, enjoy the movie. :)

Exactly! What about hospitals (where one goes to get healed supposedly) and their 5 kilowatt ERP pager antennas? I'm serious, I've seen the specs required by some hospitals here in Md for their paging network. Not to mention commercial pagers.

Like the new bogus stricter vehicle emmissions laws, if you don't meet EPA requirement you have to pay waiver penalty (in Maryland, $150 for 2 years).

Sounds like another money-grubbing scam from Washington.

In this thread there has been mentioned of the FCC study on this issue. A number of months ago I downloaded this " article " for work it prints out to be over 70 pages. We have nbeen looking at this issue for a while now casually. It was worth the time to download , lots of information was surprized to see how many typre of antennas the FCC used for testing and the tables and charts with test results included..
Download and print it today. Take a few nights to read and digest it.

ML>From: markl9@aol.com (Mark L9)
ML>Subject: Re: Why use crystal controlled scanners?

ML>Crystal scanners have ALWAYS been more sensitive than the synthesized
ML>radios and at the same time have hardly had any intermod problem AT ALL.

Untrue as a general statement. 'Sensitivity' is a function of the
amplifiers' gain in a superheterodyne. 'Intermodulation' is a
function of the linearity of front-end stages, including the first
mixer.

A frequency-synthesized receiver, scanner or not, does NOT influence
either sensitivity or intermodulation, it simply substitutes a
controlled-multi-frequency local oscillator for a large number of
crystals in the same circuit. If the "synthesized radio" LO is
working properly, it IS crystal-controlled.
~~
ML>Yeah, the programmables are certainly more flexible, but they definitely
ML>don't HEAR better than the old crystal radios.

I had a Philmore "crystal radio" (kit) as a kid, wouldn't pick up
anything but the local AM BC station. :)

...Burger King Dispatches........
Several years ago there were two dispatches that made news in the Trade magazines:
(Firehouse, Fire Chief,etc..)
...Medical dispatch to a Burger King for a man having a seizure "A flopper at the Whopper stop"
And a fire dispatch where the repeated false alarm activations had been causing the dispatchers to sing the "Have it Your Way" song. This time , however the building WAS on fire and was destroyed. The dispatchers involved, were also allowed to take up singing at another place of employment......

Funny Names on licenses....

in Chicago, we had a list of license plates that came back to real names that would cause dispatchers to crack on the air. Along with the usual un pronouncable 35 letter
long first and last names were names like Jeff Dickshot (yes, this is real!) Shorty
Rattlesnake, and others that escape my memory(haven't dispatched PD in over 10 years)

I am looking for frequencies for Houston, TX... I will be going to Rice University there in two weeks. Any help is appreciated... please respond by E-mail. (Yes, I did check Percon's database... which tells me relatively nothing due to the huge size of Houston... there were *only* 300 fire frequencies...)

Thanks,
Clay

Do not get one of the new FLEX format pagers. The Flex format uses a higher baud rate than the older POCSAG pagers. The FLEX transmitters provide less than one half of the coverage area that is provided by transmitter using the POCSAG format. Unfortunately, most paging companies are switching to the flex format. Why are they doing this? The answer is very simple. At the higher flex baud rate, they can accomodate alot more customers on a single frequency. This eliminates the cost of having to install additional transmitters on new frequencies.

Does sound like a strong signal overloading your receiver.

What puzzles me is that you describe it as white noise or static.
My one guess here would be if its not overload, then a strong signal
is being rectified somewhere causing the noise level rise. This may be
happening in a dirty connector or mounting hardware such as the
antenna mast, tower, and supporting hardware. Even look at your
grounds. The strong signal that your tuned TV antenna is picking up
may be mixing with the signals you are trying to receive.

A bad ground or oil etc between parts can do some strange things.
Two different metals will act almost like a diode and rectify your
strong signals and cause your receiver to do some funny things. You
may have to get out their and really clamp down on the grounds.

In the past I played around with an oscillator that I used to switch
or short a tuned antenna to ground at a specific frequency. (using a
diode or transistor switch) This caused any strong signal nearby to
mix and produce the sum and difference. As a result, if I tuned the
oscillator to the difference between a repeaters transmitter and
receiver frequency, it would mix the two signals and cause the
receiver to feed back the transmitter signal (audio). If this did not
happen then at least the noise level went up. This would create
signals that would cause all sorts of hell. This could be done at a
fair distance away too.

This same mixing idea can also happen in your receiver. Any unwanted
strong signal can also increase the noise floor. (level of white
noise or static) A hydro transformer in a pole outside with a bad
insulator can cause a lot of noise.

If you only get this when you plug in your discone antenna and not
outside in or around your place then look at your antenna
installation. If you get this in any other place..good luck it could
be caused in your neighbors flag pole!

I suspect the strong radio station you talked about may be the real
cause. Because it is also in the VHF band your receiver has difficulty
dealing with it. When you go to different bands your scanner uses a
hole set of different filters and the signals outside of the band

really have no effect.

I have had strong signals near by that I could rectify using a few diodes and power a LED!!! Hook up a volt meter to your antenna and if you can rectify anything you may have and look at your readings. If you have anything at all it could very well be your problem. Heck I once wanted to charge a battery with the power that I was getting bombarded with just to prove a point!

Changing antenna location may help. You may be able to overcome these problems by using your attenuator or lowering the antenna height a bit. This may be a necessary trade off to overcome these problems.

Just my 10 cents worth.

I think triangulation would be difficult if you did it right. All you
need to do is do "micro bursts". Just disrupt the data stream a tad, that
would be enough to induce problems. Say a 100 ms burst every second. At
that low of a "duty cycle" I suspect the system would not be able to
triangulate, you'd need to call in a special Military style ESM system.
With the data stream being disrupted, most of the mobiles would still
recieve the channel. Portland (Or) had their system go completely down
but it never switched to failsoft. The reason was, the data channel was
still transmitting, it was the computer that was screwed. It lasted over
6 hours.

Since you are entering all the data, any word processing program
or database program or spreadsheet will work. Just put the information
in different columns (PL, freq., channel, etc. and with a database
program or a spreadsheet you can print them out in any order. Depending
upon the program and your printer's capabilites you can print it
compressed or sideways for attaching to your scanner or carrying in your
pocket.

Matter of physics.

Remember that "restricted orifice" I tried to tell you about in a previous lesson? Here is a classic example. Gas enters the engine by either a "jet" or an "injector", either of which are "restricted orifices". Any practical pressure at all gets max gas through the orifice. The carburetor bowl holds the reserve so that inordinate demands are not placed on fuel pump, which mission in life is only to keep the bowl full. Nothing more.

The numbers, man, the numbers.

>then 50% of your signal in only 50 feet of cable. Even though you
>are gaining in antenna height your end result may be worse if you are
>losing more in the cable length.

While that is eminently true, it's the numbers that count. To lose 50% of a signal is no big deal in the natural course of radio events and phenomena. 50% is -3 dB or about a half S-unit. When you patch one antenna through a splitted to two receivers, you lose 50%. An SWR of 3:1 causes only a 25% loss.

>50feet of rg-58 cable at 400mhz is about 50% loss if I remember
>correctly. This is even worse in higher frequencies.

Again, the numbers count. RG-58 at 400 MHz has 12 dB loss per 100-ft. That's 6 dB at 50-ft. 6 fB is a loss of 75%

>But what you often gain in height may often overcome the loss in cable
>length.

Rule of thumb is an additional 3 dB of signal for every 10-ft increase in height.

>Cable is so very very important. Most people can not afford the cost
>of proper cable, and have never seen what should really be using. In
>this case keep the length as short as possible.

A scannist who can afford RG-58 can afford RG-6. It's only a penny a foot more at Radio Shack but is 4x better than RG-58 at UHF. Some people fuss about the 75-ohm characteristic impedance of RG-6. Well, down at the receiver where the input impedance is 50-ohms, that's an SWR of 2:1 for a 25% (1-dB) loss. At the antenna end, it doesn't matter because no scanner antenna has a flat 50-ohm input impedance anyway. Besides, if a balun or matching transformer is used up there, then that takes care of that for all practical purposes.

>Your [his] problem sounds like a cable (feed line) problem.

Yes....a short in one end or the other, probably inadvertantly done when the connectors were installed.

Bottom line is the numbers. Always the numbers. The decibels (dB) always tell the tale.

Guesswork does not.

: Anyone's response would be helpful

No, because the radio does not have wide FM. Wide FM is used for
broadcast, narrow FM for most voice transmission a scanner picks up.
Even if you did get an image of an FM broadcast, the narrow bandwidth
would make the signal too distorted to listen to.

Howdy, Sam, Steve, & Bill,

What is a good source for ascii delimited freq files?

I use PFS as my freq database because of it's simplicity. While I do have the Highway Patrol data in Alpha 5, it's a very complicated database engine. I've never tries the MS Works' how does it compare to other databases in this application?

I have the AM & FM Broadcast Freqs for several of the western U.S. states in both Alpha 5 (to help learn it) and also in PFS; I use the PFS version when I need to do "real work". I had to take the text files and add my own delimiting info, which was REAL fun at only blocks of 100 lines at a time in FORMTOOL, but it did work (whew!). I used Formtool because I could cut & paste the COLUMNS, everything else I tried would only cut & paste ROWS.
There must be a better way...

Enjoy, Sparky, KE6VGA

Enjoy,

Sparky

Hey Pal, LAY OFF!
If you want to insult him, do it in e0mail! Otherwise, talk about
scanners (and related subjects). I don't need to have to put in a
filter to screen out the likes of you (it takes time and I have none).

Besides, personal; insults just tell others what your real maturity
quotient is (and judging by the above remark, it is pretty low).
Flame elsewhere!
Keep it up here and I'll make sure that your ISP knows all about you
and we'll see just how far you get without an account....

Eric.

I'm fairly new to the hobby, so I could be wrong about scancat. However, I do know that MS-Works is an easy program for most people, but you still have to know something about databases to make it work. It's not to hard to just input freqs into a database or speadsheet, but wouldn't it be nice to share a common interface that has already been put together by someone else? It's really no big deal, but with a common VB program features can be added more easily.

As far as ScanCat goes, I just can beleive that they don't have a Windows compatible interface.

Anyway, if it would be a waste of time, let me know; otherwise email some suggestions to me. Thanks for your comments bill.

Price no object? Then find an ICOM R-9000 Commercial Unit. EXCELLENT
specs over 100 HZ to 2000 HZ and has a band scope too! I am not sure
if they are still available new, and they were sold to commercial and
government users. You may be able to pick a used one up. Wish I owned
one. I have to settle for the ICOM R-7000 - I have 2 of them.
(actually I would not give then up for the world!)

FWI...The Am (mw) band is local during the day, and SKIPS AT NIGHT.

As you get into the upper SW band, it's just the opposite...an 11 or 10 meter signal will be local at night, and SKIP in the DAY.

Sometimes the skip will extend into the 6 meter (50mhz) band. This is called the MUF, or Maximum Usable Frequency. For more info, try your library, which will *usually* have the ARRL handbooks.

Sometimes conditions are just right for 2 way skip in the Public Safety vhf-low band. On August I was sitting eating my lunch in Marin County, California, which is just north of San Francisco. I was listening to the Calif Highway Patrol in the 42 Mhz band when I started getting signals from the Florida Highway Patrol. These two agencies were not only on the same frew, but (I assume) had the same PL tone. The Florida dispatcher was telling her units that they were being "covered" by California traffic. At the same time, dispatchers for the "Silver" CHP channel in Marin County were telling her units they were being covered by Florida radio traffic. The signals from Florida were strong & clear...I caught the Floida callsign and called a friend at the FCC and confirmed it was the F.H.P.! My boss wasn't happy I was late back from lunch, but, I just HAD to keep listening until I caught that callsign.

This was FM skip at it's best !!!

What the original poster says is true about vhf-HIGH and UHF bands; that's tropo DUCTING, where the signal bounces between two layers of atmosphere, or between the atmosphere and the ionosphere, usually during a temerature inversion...SKIP is in the LW, MW (am), SW and the LOW-VHF bands, and it is

where the signal bounces between the earth & the ionosphere layer(s).

Enjoy,

Sparky

Hello
I have a Radio Shack Pro 2027 scanner with vhf & uhf hi-lo-air full coverage of the 800 mhz band including cellular up to 960. This is a desktop unit with either a telescoping ant or external ant via a bnc. The unit is in near new condition and works flawlessly. Built in power supply so no need for 12volt in the house.
Price is 175.00 shipped anywhere in the USA. If interested please reply via email.

Check out the info on the web for the Uniden 9000.
One of the "tips and tricks" documents explains
that celluar images can be received in a certain
freq range that the 9000 can receive.

I can't remember the exact freqs, but I think they
were somewhere near 385Mhz. You can find the
info if you do a web search for the 9000.

Will you folks kindly take your discussion back to the Rec.Radio.Scanner newsgroup, and leave us alone here?

This childish in-fighting by ALL of you is why many good folks have left the REC.RADIO.SCANNER group because of totally stupid flame wars.

Bill Cheek IS NOT the moderator here. He moderates the REC group, NOT this ALT group. Please return to THAT group to continue your time wasting diatribes! We don't want, need, nor desire it here.

THIS group (ALT) is neutral territory...Please be adult enough to respect this concept. If you persist in dragging this group DOWN to the level of the REC group, complaints to the ISP of ALL parties concerned will be made. We prefer not to do this...we're here at the ALT scanner group to focus on radios, NOT your egos. I say this from a neutral standpoint TO ALL PARTIES.

Lets act like the intelligent, considerate people we allege ourselves to be!

THANKS, & happy radio monitoring...

915. ScanWare - End of FCC FRS

Newsgroup: rec.radio.scanner
Date: 1996-08-09 00:00:00 UTC
From: scanware@sincom.com
Message-ID: <320a949a.19683072@news.cais.com>
Source record: 227177
Cross-posted to: alt.radio.scanner,rec.radio.amateur.misc,rec.radio.scanner

In the fall of 1993 ScanWare Associates released version 1.1 of the FCC Frequency Retrieval System (FCC FRS). In the following months improvements and enhancements were made until the latest version, 2.15 was released in the summer of 1994. The program has proven to be so stable and user-friendly since that time that no further changes were deemed necessary. The FCC FRS as a DOS-based program has enjoyed exceptional popularity and has proven itself a valuable tool to over 1000 customers who have used and continue to use the program. Only twice in the entire history of the FCC FRS has ScanWare been asked to refund a purchase. It is believed that no other frequency retrieval program either DOS or Windows based can make that statement. Judging from user comments that we have received, no other retrieval system has ever produced the level of user satisfaction that ScanWare's FCC FRS has provided.

It is with much personal sadness that ScanWare Associates announces that on September 1st, 1996 we will no longer be accepting orders for the FCC FRS or any related products which we have offered in the past. Our most recent purchase of data includes the 1st QTR 1996 FCC Data. No further updates of data will be forthcoming from ScanWare. We will continue to honor any outstanding free database certificates however data provided will be limited to the current database on hand. Any certificates sent in for redemption must be accompanied by a check or money order in the amount of $5.00 to cover media, preparation, and shipping. Credit card payment will not be acceptable. Technical support of all ScanWare products will be limited only to any answers or solutions which can be provided via email. Replacement files may be provided via email at ScanWare's discretion but we make no claims or guarantees as to their continued availability.

The ScanWare Associates BBS will cease all operations at midnight on August 31st, 1996. The ScanWare Associates Web Page at URL:
http://sincom.com/~scanware/index.html
and the ScanWare Associates email address: scanware@sincom.com
will continue operation until such time as we consider their usefulness at an end.

ScanWare Associates wishes to thank all of our customers and friends who have supported our efforts. We hope that you will continue to use the FCC FRS as you have in the past and that you will continue to remain our friends. Although we will no longer be retailing the FCC Frequency Retrieval System and its related products, ScanWare Associates as an entity will continue to exist and we will continue to pursue activites in those areas of most interest to us. Perhaps in

the future we will meet again.

Sincerely,

Gene McAvoy, KG7XD
and
Matt Amis, AA7LP

Have any of your considered this:

Ok...major cities get into trunked and digital.
smaller areas continue with what is in use now.

Have you any idea what this will do to people who buy
scanners? Or don't...and why. Think about it...if
the numbers are sold to larger cities with plenty of
buyers ... as is now, then what happens when this
source is no longer buying because it's impossible
to listen.

What about Uniden/Bearcat and Radio Shack. How many
people do they employ making scanners?

If there is no demand as there is now...how far do you
think this "employment" will last ? And when supply
is not in demand...people get laid off and what is
produced for the marginal sales they get from those
small municipalities who can still count on the old
systems.....how high a price will those Grove or Scanner
World or radio shack prices stay at $260 for a good 800
mghz scanner....desk or portable?

How many people who used to do not listen any more because
they cannot and then the prices go up to over $500 or more
for that unit?

Think about this a bit....supply goes down and prices go up.
Next, who buys out each other? then, who decides to sell to
a bigger conglomerate and prices rise again?

YUP....sure looks good for what ails you.

Don't throw in the towel yet. Many "burgs" still use the 154 MHz public safety band. They haven't seen the need to move to 460 MHz yet. If you want to follow a late breaking news-worthy event and your city is trunking its public safety, try monitoring the media studio feeds around 161 and 453 MHz. I find these just as revealing.

Although I don't condone breaking the ECPA, some double conversion
Radio Shack scanners (i.e. PRO-2030) will pick up cell call images from
the top of the blocked band, 896.1125 to about 917 MHz. Subtract 21.4
MHz to realize the actual cell tower frequency. High end triple
comversion receivers are harder to "fool" into detecting images.

The Jet would certainly be powerful, but why reinvent the wheel? So
many before you have done it.

But since you referred to ScanCat, you must have something else in
mind. How about elaborating on it a little? As for a plain old
frequency database manager, geez, man, you can't beat MS WORKS.

The hobbyist can make his own menus, his own fields, and dress 'em up
any way he likes, and then add or subtract as he wants. Plus,
searches, sorts, queries and printouts/reports are totally under the
control of the user.

It's mighty hard for a stand-alone freq database to beat that. So
what did you have in mind? If it were a freq database, maybe you
ought to take a look at the dozen or more that are already out there.
But ScanCat's more than a database, right?

I agree with you for the time being. I think, however, that sooner or
later, encryption and spread spectrum, not to mention wire/fiber/space
will consume more and more of the land communications bandwidth.

That means more and more scannists will drop out. A smaller market
means either less potent equipment or more expensive or both.
Manufacturers will drop out. Magazines will drop out. Advertising
will go through the flooor.

A community of diehards will be left....listening to ATIS or NOAA
signals.

:-(

> Besides, even in large markets, not everyone is going
>trunked. My favorite agency to listen to is the Arizona DPS. Anyone
>know if they ever plan to go trunked? Somehow, I doubt it (I do not
>claim to be an expert, however) as they need statewide radio capabilities
>in all of their portable units... (Can a trunked system handle that?)

Trunking is not a panacea; rather just a stop-gap. The panacea is in
the space segment and DBS technology. And this will inch out of the
hobbyist's grasp, thanks to law, encryption, and directivity of the
uplink transmit sites.

There is time left. But the times ... they are a'changing, methinks.

'Sniff.

Wow, no kidding?

So criminals shouldn't be jailed, "whether they deserve it or not"?
If a wannabe mugger approaches your wife and..... you'd do nothing?

Where do you draw the line between "appropriate" and "inappropriate"
and where are these standards to be found etched into the granite of
Life?

Lastly, why are you "considering" dropping the subscription and
talking about it in public at the same time? Do you want others to
support your "considerations" and deliberations? Are you drumming up
a little gang-bang or something?

Off color remarks! Geezus, fella, what kind of leverage are you
contemplating on those "offenders" whose remarks were ten times more
vulgar and obscene than mine? Are you working on them, too? Go up
your article queue just a little ways and look for a post from
"Drunkman". What are you going to do about HIM?

And let me guess......YOUR remarks above are "on-color" and very
appropriate for this forum, right?

Ri---ght.

929. Which scanner for me?

Newsgroup: rec.radio.scanner
Date: 1996-08-09 00:00:00 UTC
From: GHVZ65D@prodigy.com
Message-ID: <4ueae8$gv6@usenetz1.news.prodigy.com>
Source record: 227191

Greetings,

This is an all-out, general sort of appeal for advice and help. I am planning on purchasing a handheld scanner. I am forced to stay on the used market, due to a lack of funds and inability to get more (I'm 15). What do you use? What can you recommend? I'd *really* like to get a BC-3000XLT but can't seem to find any that have been gently used and under $200. Generally, how do the Bearcats perform compared to Radio Shacks "Pro" series?
One other minor detail...my parents do not want me to own a scanner. I think my dad would allow it, but my mom...well, you have to know this woman. She is an reporter at a big, metro newspaper. You'd think she would believe this was great, being able to hear stories as they unfurl. But she is totally against it. She complains about sitting in the office and hearing those damn tones go off all day. I tried to convince her that it would be the size of a cordless telephone, and totally uninvasive. I think her image of scanner listeners is that of the neighbor next door who knows everything about everyone or the REACTers of the '70s standing at a traffic accident with marine orange slickers. I am a ham, however, which she does take seriously.
Any advice, or consulation otherwise, would be greatly appreciated.
Oh, and anyone who can hook me up with an inexpensive working scanner should reply. Or, I'll take *any* kind of broken but repairable radio equipment for the price of postage.

73s,
Josh

steve....

iN THE LATEST scanner book...that's about five or more
pages...why not just go buy the scanner book for
Santa Clara County from Scanner's Unlimited in Los Gatos
Tell Glen I sent you....its' on Laurel ave... in the
phone book and Gle will mail one copy to you...and it
is not costly at all.....Santa Clara county has the most
frequencies in the Bay Area for just one county......well,
San Mateo is close.

Call Glen...pay the price of the ticket and have more than
given....

Your write a very well thought-out article Ron, but this is all news
to me. I have to wonder 2 things. First, what is your source for
this information, and second, given that there are numerous "sharp
points" on the undercarrage of a vehicle that are in much greater
proximaty to earth, why would the tip of the antenna even be a concern
as it relates to static? The radio system is grounded to chassis as
is.
Do projections on an airplane all terminate in a ball?

Mark

The truth as I perceive it to be.
Your perception will be different.

: Locate & identify transmitters in your area with RadioMap(tm)

Those little button batteries for the memory are located inside the other
battery compartment. Open the compartment, remove the holder for the 6 x
AA cells and inside is a small panel one can slide over and then remove.
When replacing these batteries try to minimise touching them with your
fingers or clean off the surface. Body oils can oxidise on them a bit and
reduce contact. Replace that little panel and slide into place. Replace
AA cell holder and re-enter freqs! TTFN John

Source record: 226905

What is involved in modifying a 220xlt to receive the full 800mhz band?
(ie: CELL PHONES)

I've done the mod several times on 200xlt's but as I understand, the
220xlt is a much smaller unit... Can it be modified? and whats the
procedure...?

Any help appreciated.

THANKS.

Source record: 226911

GS>From: gary.sellani@solis.sbay.org (Gary Sellani)
GS>Subject: Re: NiCd Cell & Recharger

GS>MS>Discharge an AA penlite through a flashlight lamp. It doesn't
GS>MS>get hot as the cell approaches zero voltage.

GS>I suspect you will want to charge that dead cell. If you dump a lot
GS>of current into it while the cell voltage is low, it will get hot
GS>due to the higher series resistance. Most fast chargers trickle the cells
GS>to 1v before fast charging to avoid this.

I'll just throw in a quote from EDN magazine, May 24, 1990, "Thermal Charging Circuits Safely Boost NiCd Batteries," pp 147-152, by Jim Williams, staff scientist at Linear Technology Corp., Milpitas, CA:

"The temperature response of a battery during charging is quite predictable. A discharged battery converts current to stored electrochemical energy without producing much heat. However, when the battery arrives at full charge, the cell is saturated and can't hold any more energy. As a result, the battery now prouces heat, and its temperature increases."

Linear Technology is one of many semiconductor manufacturers who make specific battery charging ICs. The emphasis on proper charger design for the ubiquitous NiCd cell in technical literature has always pointed out heat-sensing as a definite need to avoid cell damage. You will also find the same statements in tech info from Maxim, National Semi, and (recently) Motorola among the IC makers plus all the battery manufacturers' detailed information.

MM> I am having a problem with what appears to be interferece from my
MM>vehicle speedometer to one particular frequency 154.875 which is my
MM>local Sheriff's Dept. and is a must for monitoring (my wife works
MM>there). But I get a whine and it breaks the squelch as long as I am
MM>moving and when I stop it quits. Engine rev has no effect so I don't
MM>think it is the ignition. Vehicel is an 89 Chevy Blazer and scanner is
MM>a Uniden MR8100A with side mounted window antenna also have tried
MM>roof mounted magnet base. Any help would be appreciated.

You might sniff around the microcontroller (probably on the firewall
on the driver's side) with the loose end of a coax antenna cable. If
it isn't a birdie in the Uniden then it could be a harmonic of the
engine microcontroller? (I doubt it but it's a thought)

It's possible to sniff RF this way with the connector on but it would
be more sensitive with an inch or so of the center conductor
protruding. Wrap the end with masking tape to avoid shorting out any
exposed 12 VDC connections behind the dash.

Well, I don't know much about ScanCat myself. Other than it is a "control" program for a lot of different kinds of radios. It may have a database with it......I dunno about that.

> However, I do know that MS-Works is an easy program for most people,
> but you still have to know something about databases to make it work.

Wellllllllll, it would be helpful to know a little something about databases, but with WORKS, it is self-guiding, especially the Win95 version. I know one prominent scannist who didn't know a database from homebase until I turned him onto WORKS. He was an "old fart", too old to learn new tricks......but he took to WORKS like a duck to water. Ain't nuthin wrong with folks having to learn a little something new now and again........

> It's not to hard to just input freqs into a database or
> speadsheet, but wouldn't it be nice to share a common interface
> that has already been put together by someone else? It's really
> no big deal, but with a common VB program features can be added
> more easily.

Ok, try to follow me here. You're cool. You KNOW how to slap a good database together so nincompoops can use it. First off, that makes you no different that several dozen before you. I know of a couple of dedicated database programmers who tried this concept. Pro's, mind you. Both developed sound, solid products. And ???. WHO out there today remembers "ProScan" and "RAC"? These programs flourished for a while. They were good. But.....they were locked down. Hard to get data into or out of.

The thing about MS WORKS for WINDOWS is that if you need a common interface, then create it on the fly! But there is no such thing. No one has prescribed a common interface that works for all or that is universally accepted. No big deal with WORKS. In seconds, you can arrange your data and format to be compatible with the next dude's.

WORKS will import and export in a variety of STANDARD formats, including *.DBF, *.TXT, and quite a few more. In AND out, see? And while you're working with your data, you can do whatever you want with it.....on the fly......add new fields; delete fields; rename them; .... so easily and flexible!

>As far as ScanCat goes, I just can beleive that they don't have a
>Windows compatible interface.

There are still a lot of people who are anti-Windows....or just pro-DOS.

>Anyway, if it would be a waste of time, let me know; otherwise email
>some suggestions to me. Thanks for your comments bill.

Waste of time? Hooooooo boy, that's a loaded one. I dunno. If you whipped up a database manager that ten people got some good use out of, and learned enough to move on to bigger and better things....would that be a waste? I doubt it. Any kind of learning is good.

What I am saying is that a bunch of guys before you came to the same crossroads where you're at now. You are going to be on well traveled turf for a while. And then you are going to come up to the same brick wall they did. HOW TO MARKET THE DARNED THING AND GET IT UNIVERSALLY ACCEPTED? From that point on, you'd be on your own. That one program called RAC was perhaps the most widely accepted for a time....several years, as a matter of fact....but that was largely due to internal promotion by the CLUB that the fellow belonged to, and where there could be some good old fashioned backscratching to get the thing rolling and on its own power. And RAC was good. Sort of.

But you don't hear of it anymore.

Now the thing is......MS WORKS is whatever the User wants it to be. If he wants a 4-column (field) data base with a hundred entries, then within seconds, that's what he's got. Next week, he wants 6 cols and 1000 entries? He's got 'em.

Next month, he wants 47 columns and 25,500 entries? He's got 'em. All the while, if he wants to frenchify up the "interface" to make it look all slick, wicked and pretty, he can do that, too. And then change it the following week. And when someone like me posts a batch of frequencies, say like this:

,241,418.6250,,D,,,,,,DEA Ch. 1 Ops
,242,418.9000,,D,,,,,,DEA Ch. 2 Central Mass Ops
,243,418.7500,,D,,,,,,DEA CH. 3 Surveillance/Strike Force/Wire Patch
,244,418.6750,,D,,,,,,DEA Ch. 4 Surveillance/Strike Force
,245,418.8250,,D,,,,,,DEA Ch. 5 Ops
,246,418.9500,,D,,,,,,DEA Ch. 6 Ops
,247,418.9750,,D,,,,,,DEA Ch. 7 Ops
,248,418.9750,,D,,,,,,DEA Ch. 8
,249,416.0500,,D,,,,,,DEA Long Island
,250,418.7000,,D,,,,,,DEA Nationwide

,251,418.7250,,D,,,,,,DEA Nationwide
,252,418.7500,,D,,,,,,DEA Washington F3
,253,418.7750,,D,,,,,,DEA Nationwide
,254,418.8000,,D,,,,,,DEA Nationwide
,255,418.8750,,D,,,,,,DEA Nationwide
,256,418.9000,,D,,,,,,DEA Bridgeport, CT
,257,418.9250,,D,,,,,,DEA Nationwide
,258,419.0000,,D,,,,,,DEA NY Task Force

It won't take him but a minute or two to drop that pile into his own database; weed out the superfluous bullshit; and retain the meat 'n taters, see? It would take a lot more work to drop the above pile into a proprietary database shell.

Waste of time? Before I answer any more of that, let me suggest that the scanning hobby has matured enough to where we can talk about some real standards and some real ways of managing data, but in ways that we can more easily share and swap with each other. Let's face it, we all have to speak English here, else we're not going to understand each other. Well, it is important that each scannist have a basic understanding of his computer and to be able to operate some tools of the trade. An integrated program like MS WORKS can easily lead a feller into the Big Time with the boss hawgs like ACCESS, Paradox, Approach; PFS, Oracle, etc. But you gotta start somewhere.

For those who can't start with MICROSOFT WORKS FOR WINDOWS for whatever reason, then a proprietary closed database shell might be the ticket. And then not a waste.

Steve, it's a damn tough call, man. Others have made the trek before you. Grab up some of their work and see what they did. Maybe you can figure out where they went wrong and add more concrete to the foundation. I think there are still a handful of scanner databases on my BBS. If you want, I'll file-attach one or more to you for your look-see and judgment.

I think you owe it to yourself to do a little research UNLESS you do things like that for the fun and the hell of it. In which case, it doesn't matter what I or anyone else thinks, really. If it's for profit as well as a contribution and benefit to the Hobby, then it deserves the research, first.

Did I say all this right?

-= Bill Cheek =-

It is amazing to me that with all the talent connected to inet that there seems to have been no solution to the spam crap. Calling their 800 no from coin phone and leaving off hook is probably a way to sort of get even, if enough people did it. The coin phone, L.D. and local service providers split the revenue for the call. The next person who wants to use the coin phone just hangs it up and uses it. If the spammer has a time-out on the line to disconnect it, they drop the call. It'll still cost the spammer something.

I have to echo Bill's comments about MS Works. It took me all of twenty minutes to create the format I wanted for my frequency database and I had absolutely no experience creating databases at the time. It's simple, easy, not frustrating and most of all, it works.

956. Little Balls On Antennas Tip

Newsgroup: rec.radio.scanner
Date: 1996-08-10 00:00:00 UTC
From: ronkatz@interlog.com
Message-ID: <320c4ac2.12970169@news.interlog.com>
Source record: 226998

What is the Ball for on the tip of my antenna?

Well, it's not just for looks, safety, or to stop ribbons that you tied onto your antenna from slipping. It's to stop static electricity from leaving you antenna and causing radio noise and possible damage due to static discharges.

Static electricity can buildup on your car during low humidity and due to friction. This friction may be from your car passing through the air to the fan belt turning against a pulley. Because rubber tires insulate your car from the ground, static electricity must find a different path to discharge. This discharge can happen when you touch your car completing the path to ground, or even discharging back to the air again.

Electricity or static electricity will always take the path of less resistance. This path of less resistance can be a sharp point. A point offers less resistance then a dull one. This point can be the tip of your antenna. Even though air is a good insulator, if the difference of potential is great enough static will still discharge through the air. What this means is noise and possible damage to your receiver. The ball on the tip of the antenna may help to prevent this.

Electrostatic discharges can easily destroy a piece of electronic equipment. Looking through a microscope, a semiconductor zapped by static looks as if it where a building hit by an asteroid. Remember, your receiver is designed to receive signals measured in micro-volts not at the high voltage present during a static buildup. Sudden but short static bursts cause radio frequency interference. Think of the noise spark plugs can make in an automobile.

Here is an interesting opposite idea used to help prevent lightning strikes to large structures. Sharp grounded points connected to ground wires are found on some building roof tops. They are not to provide a ground path for lightning or to prevent possible damage from it, but are to help discharge a difference of potential. By doing this the structure hopefully will appear just like any other structure around and not be a better target for a lightning strike. This charge that can build is opposite to the charge in the clouds and because opposite charges attract, lightning has a greater chance of striking. In this case, you want the points to help discharge static or help to equalize static charges. On your car you do not want this to be the point where this happens because of the effects to your receiver.

I recently saw an advertisement by a company claming they sold these "Balls" that attached to your antenna and improved the signal strength. This was an interesting claim. What made it even more believable was that they claimed the USA used these "balls" in the golf war on their tanks. Well, I don't think so. I am sure the air was dry and static was everywhere but, this can not improve your signal strength. Maybe help lower noise level if static discharge is a problem and the antennas had no ball but getting something for nothing is still not possible.

Do your mobile antennas have balls!?

What do you think?

Sheesh, doesn't anybody look at file lists on BBS' anymore? Years ago there
was a DATABASE that I had download that does excatly what he's asking for.
It's called Tune-in. If anyone wants it let me know, I'll email it to you.

What the program does is allow you to put frequencies in by channels & banks
and by scanner (for those of us who have more than one or two)

Hi All

This is just to let you know that the latest version of my POCSAG paging decoder (PD 2.02) is now available for download from my web page:-

http://www.bearnet.demon.co.uk/

The program is shareware - full details are given on the page.

Pete.

I also agree with Joseph and Bill, et al. I have always found it best to do lists like this in Excel (my personal preference - Works, Lotus, Quattro Pro, your favorite database, etc. - whatever your personal bias is) where I could easily change the format to make different styles of reports or only print certain sections, etc.

But to answer your original question Sam, you were trying to remember the name of a frequency database that you had seen several years ago. Perhaps that was Scanner Buff (scanr###.zip - where "###" is a version number). You could try to do an Archie search on the Internet for it or check a few of your local BBSes. Aaron M. also suggested Tune-In...I'm not familiar with that one but these are probably what you are looking for. Send me an E-Mail note if you can't find it and I'll see if I can help.

Good luck!
Bill

The discone really isn't a very good antenna,especially compared to the scantenna.A discone has a flat SWR,but no gain.Actually,a simple ground plane will blow a way the discone.I know,I've tried it!I have an Icom discone in my attic.I made a ground plane cut for 440 mhz.At the same height,the ground plane outperformed the discone by a wide margin on 440,460 and 800-900mhz.The discone was equal on VHF High and was a little better on Low Band.At least it was better on some freq!The only thing is a cheap CB antenna blows it away from 50mhz on down.Unless you want a backup antenna for 2mtr and 440 ham use,save some money and buy the scantenna.I'm going to get one soon and just use the discone for a backup in case the scantenna blows down in a storm.

Well, again, it's the numbers that do the talking. In a splitter, 50%
of the signal power goes one way and 50% the other. Yes, there is a
conversion loss. But it is not 50%. More like 0.1-dB per connector,
and that is splitting hairs to where it's generally not productive to
whop onto the hobbyist's head when all he wants to know are the
fundamentals.

BTW, a properly designed splitter does not change the impedance. It's
better called a "power divider" and there is no real conversion loss.

>As for S-Units being 6 db/unit (you said 3db is about 1/2 s-unit)
>I would have to disagree with you here.

6-dB per S-unit is the "standard", with S-9 related to 100-uV
(microvolts) in some systems; 50-uV in others. I have seen 25-uV as
S-9 in some receivers.....rare, though.

> Aside from maybe CB radios I'm not aware of any other reliever
> that has such a scale. That is 3db=1/2 unit, Any examples?

CB, ham, and shortwave radios. Not many others use S-meters. But
6-dB per S-Unit is pretty well the standard, though in actual circuit
measurements, one radio may prove to be 7-dB per while another comes
in at 4 dB per. THAT is largely due to circuit tolerances, and meter
scale calibration errors..

>Many scales I'm used to using are in fact using the Decibel system not
>S-Units,

Not for RF, they don't. Audio, yes. Video, yes. RF, no. S-Meters
are, by convention, set for S-units from 0 to 9, and then decibels

ABOVE S-9. S-9 is the reference. We're talking SIGNAL METERS here.
Not signal generator scales or oscilloscope scales where calibrations
are indeed, often in "dB" or "dBm"..........

> perhaps there are cheeper units that will use some inaccurate
> scale I don't think I would use it to measure or compare line loss, or
> antenna gain by this.

I would..... and do. :-) What's wrong with that? If you tune to
a NOAA or ATIS station and then run a test; change out the coax and
test again, what else would vary BUT the coax? An S-meter will tell
the truth in such circumstances.

>An RF micro volt meter or Service Monitor would be a better choice if
>one wanted to make such a comparison. (not everyone can afford one!)

Yeah, THOSE work, too. Not necessarily any better, though.

> I would only use these 's-meters' for relative measurements but that's
> about it. Again they must say what a S-Unit is.

S-meters are, by definition, indicators of "relative signal level"
(RSL). But that is generic. On the other hand, if a receiver is put
on the bench and injected with a range of RF, and the S-meter
annotated with its response to known inputs, then it becomes a very
useful and economical tool.....every bit as good as a "service
monitor".

But even without calibration, an S-Meter is still a super tool for
alignments, antenna comparisons, and evaluations of RF path/link
performance. If you get an S-9 on a nearby NOAA station with one
antenna and S-8.5 on another, then there is a half S-unit difference
between the two. If you KNOW the response factor of the meter, then
you can convert it to "dB" gain or loss.

>Correct me if I am wrong but a S-Unit is not a unit of measurement

It IS........when you MAKE it so. And it's not all that difficult to
do. But.....in general, when a CB'er says, "Hey, Onion Cider, you're
a'hittin me with an 8" and another says, "You're kicking a 10 over 9
here".......well.......that's fodder for a grain of salt. To that
extent, you're right.

>>Rule of thumb is an additional 3 dB of signal for every 10-ft increase
>>in height.

>This is incorrect.

Ohhhhhhhhhhh good grief!

> While you may gain in height you can not say or
>show that it is 3db for every 10 feet.

Ohhhhhh yesssss I can!

> We are talking about ground signals here.

Yes? The correct terminology is, "Plane Earth Propagation", but yes?

> If you are not in line of sight then yes your will gain.

Yes....but also within line of sight, yes!

> If you are in line of sight then hight will only serve to
>increase the distance between your antenna and the radiated signals
>pattern. It depends on the propagation of the transmitted signal.

Oh poppycock! Rubbish! Where do you get this crapola? Ok, ok, ok,
let's do Propagation 101 for a minute.

First of all, there are two kind of VHF/UHF waves: Free Space and
Plane Earth. Free space waves do not depend on the height of either
Tx or Rx antenna above ground. In fact, height is not a part of the
equation because there is no ground in the field. Free space waves
are those waves where the closest point of approach to the earth is at
least one full Freznel zone, and preferably three. Freznel zones are
determined by wavelength....aka frequency.

Plane earth waves most assuredly have heights of the Tx AND Rx
antennas in the equation. I regret to disillusion you, but there is
no such consideration as "line of sight" except for, of course, the
propagation of...LIGHT. Otherwise, "line of sight" is only an
elementary thingy laid on neophytes, novice hams, CB'ers, Basic E&E
students, and news cameramen, so they can grasp the rudiments of the
idea of the inverse square law.

>Microwaves, Cellular phones etc. are very much line of sight.

Ohhhh nooooooo they're not! Who told you that nonsense?

>And ground waves. Its like a car headlight. If you are even 10 feet in the
>air it will make a difference, you will not have the light shine in
>your face. The only time hight will make a difference is when you are
>helping to overcome some line of sight obstacle.

Ohhhh Geezus..... more Prop 101. Light waves are micrometer
waves. Life behaves different from lower frequency waves, even though
there are similarities. Besides, a car's headlights are beamed by a
reflector! Without the reflector, there would be no change in
apparent brightness if you rose into the air. Geez, doode, THINK
about it. If that oncoming car stopped and raised the front end up in
the air, then you'd see the same brightness.

Ummmmmm, you ever hear of a property called....diffraction? Well,
radio waves diffract much differently than light. Even light
diffracts....around objects, molecules, etc. Radio waves diffract
much more so. Radio "line of sight" differs much from optical line of
sight. But even so, the only thing that matters pursuant to your
elementary concept is IF the radio wave passes more than a Freznel
zone above an obstacle.....such as the ground. If it is within a

Freznel zone, then the propagation is dependent on antenna gains,
antenna heights, and distance between the antennas.

The propagation of a free space wave is dependent on strictly distance
between the antennas, antenna gains, (inverse square law) AND
frequency (varies directly at 6-dB per octave).

>Look at Cellular phones, pagers, trunked radio system with voted
>receivers etc. They point their signals down off tall structures.
>You can live in an apartment building with a pager transmitter across
>the street and not be bothered by the signal but as soon as you are at
>ground level your blasted by RF.

What does that have to do with the price of toilet paper in Timbuktu?

You stated the problem AND the answer, neither of which has anything
to do with propagation. DIRECTIVITY of the Tx antenna!!! Geezus,
Katz???? Use a high gain antenna with a narrow beam angle to give
deep nulls off the sides, and sure.....what you say is true. But it
hasn't a thing to do with "height", "space", or "line of sight". Same
as your headlight analogy above.

>This is why I disagree with your 3db/10feet rule.

Suit yourself. But you ought to exhibit neither nescience nor your
arse in public.

>>>Your [his] problem sounds like a cable (feed line) problem.

>>Yes....a short in one end or the other, probably inadvertantly done
>>when the connectors were installed.
>>
>>Bottom line is the numbers. Always the numbers. The decibels (dB)
>>always tell the tale.

>And using 3/4" heliax is only 3db loss (close to it) as compared to
>your rg-58 12db loss at 100 feet (400mhz) Compare this feed line at a
>few dollars per foot to a few cents for foot of cheeper cable.
>
>I've used Heliax and had some great success.

I -do- use Andrew LDF2-50 cable. But that is beyond the reach of most
hobbyists, and I don't really like the stuff. In fact, I use RG-6 on
several of my antennas.

>---
>BTW the CN tower if you ever get a chance to check out the radio rooms
>full of transmitters/receivers you'll see some cables the size of
>water hydrants! a foot in diameter or more.
>---

A foot is kind of stretching it, but 6", yeah. The bigger stuff isn't
coax, though it behaves like it. It's actually....PLUMBING, fitted
together in sections.....and pressurized with dry nitrogen or other

inert gases.

>Thanks for your input Bill. I prefer this type of conversation over
>the personal attacks.

Well, then, don't be disagreeing with me unless I make a typo error or you know beyond a shadow of a doubt that I said something wrong, and even then, you'll probably be coming from some elementary concept that really isn't correct, but is a common method of stumpbreaking a green weenie..

(But I ain't done it yet.)(Typos here and there, yeah. I can't type with a diddley-hoot.)

You are just craving....frothing.....panting..... to catch me not knowing what I am talking about, but the folly of that is-- if I don't know, I either don't talk about it, or I ASK.

You seem to be ill-advised that scanners are my profession and realm of mastery. Sorry. Scanners are a sideline. An area of interest. A hobby. And yes, I have mastered their technology pretty much. But MY world encompasses so much more.

Ummmmmmm, I am a -=master=- of VHF-UHF propagation. I've studied Bullington and Saveskie to such depth that I've come to love their grandmothers. I designed, engineered, furnished and installed over 300 VHF and UHF telemetry links in Colorado, Wyoming, Nebraska, and Montana. There was no "guesswork" involved. I plotted every square inch of 300+ RF paths, varying from a few miles in length to upwards of 70-mi. I applied every possible variable to derive best and worst case conditions, and then physically tested a third of them before ground was ever broken....to validate my models. They worked. I still design RF links. Blindfolded. Hands tied. All in my head.

Ummmmmm, Katz? As a general rule of thumb, the hobbyist can expect a 3-dB apparent gain for every 10-ft increase in height of his antenna. The exact amount will vary with frequency and other factors.

Now just as I don't have to qualify the daytime, cloudless sky as blue and fresh shit as stink, neither do I have to qualify that increasing Rx antenna height will have no effect on the RSL from an handi-talkie across the street. BUT, for a police car down the street?

Yes, indeed, height will make a difference! A VHF radio wave traveling 6-ft above ground for a hundred yards will lose more than the same part of the signal that travels upward at a 6-degree angle. Meaning that an Rx antenna at ground level will get less signal than one at 30-ft, even within 100-yards of the police-car transmitter.

That said and over with, it CAN go without saying that the hobbyist will not raise his antenna 20 more feet to hear a NOAA station a mile away. He WILL raise the dern thing to hear signals that he presently can't hear. At those distances, the apparent gain can be quantified

as 3-dB per 10-ft. 20-ft added height will result in more signals with full quieting, and a detailed analysis will result in a qualified 6-dB of relative gain. There is nothing to argue with that, never mind that SOME signals will calculate to be 4-dB of apparent gain and others at 8-dB.....

"Line of sight" is a concept used to gently break in green weenies. Other than that, it has little meaning of substance in radio. Fer instance, out on the high seas where the earth's curve is as proper as can be, VHF/UHF signals can be detected at least 15% farther than the optical line of sight.....i.e., BELOW the horizon.

Life sure has its little twists and turns. First, a few people holler and snivel about taking off-topic conversations to e-mail. Ummm, ok, but sometimes that is a problem, especially where the poster has a fake e-mail address, OR where like little Danny Browning tells me to not send him e-mail as follows:

```
----------
> From: Danny Browning[SMTP:dannyb@usit.net]
> Sent: Thursday, August 08, 1996 3:35 PM
> To: Bill Cheek
> Subject: Re: Crime on the Internet
>
> Do not e-mail me back. If you have a problem then take it up with
> My ISP. This the only warning you will have. I have nothing to say
> to you except Grow up!
----------
```

Hey, the fellow "warned" me and I take warnings seriously. So, since I can't e-mail the lad, he will have to get my reply here.....it does have something to do with scanning, and is therefore, topical.

First, the history. Seems a few days ago, Mr. Browning sniveled and threatened my ISP with mail overload because I was

>"causing havoc on a newsgroup".

My ISP took it seriously and asked me what was the deal. I showed 'em and they checked it out and that was that. I am not "causing" any problems. But Mr. Browning might be bringing a whole world of hurt down on himself by freely admitting his involvement in listening to cellular conversations and in "mapping" the cellular provider's system. I understand he may be denying this now, and since he's the kind to cause REAL trouble, following is a verbatim copy of his confession of committing a REAL crime:

```

Tell him Ken

I too do this all the time. I have a freq counter and this makes it
very easy! I know where 90% of the cell towers are and what freqs they
are on and I have maped them out. I can follow cell calls (most of the
time) by just listening to them talk. They usally tell where they are
and this makes it easy to track. I dont live in a big city but it is a
pretty big town.

================================
END OF MR. BROWNING'S CONFESSION
==

So what's the moral and point of this? Well, there are several.
First of all, the "pot" has no business calling the "kettle" black.
The same principle is exemplified in the Bible...something about
chucking stones at other folks.

But it's bigger than that. I mean, sheesh, you just DON'T go into the
"attack and threat mode" when your own backside isn't very well
covered. Now for Mr. Browning to go complaining about me, and making
threats to my ISP when only a little while before, he openly talked
with authority, confidence and impunity about his violation of the
ECPA of 1986.......is an exercise in ....oddity, if not idiocy.

But bigger than that even, is when a dude like me goes to e-mail with
such a silly fellow, he just oughtn't up and force me to go back
public with the whole deal. That's downright dumb.

But anyway.......for everyone else out there, the prima facie value here is the sage advice to NOT go bragging about your exploits and adventures in the cellular bands and other illegal activities, or at least don't just out and out CONFESS IN PUBLIC to violating these laws. This is one of those deals where you have nothing to gain, and maybe a whole lot to lose.

As far as I know, the physical act of modifying a scanner for cellular is not illegal; nor is the act of owning a scanner that is capable of cellular reception. And as far as I know, it is not illegal to discuss the physical aspects of what it takes to modify a scanner to receive the cellular bands. But geez, dudes & dudettes, it can't be real smart to openly talk about listening to cellular signals.

<Mileages and opinions may vary, of course.>

What you are saying may come true for the audio trunk systems. However the new standard is the digital trunk systems which will make even those scanners obsolete.
Your only option might be to bribe the technicians involved on the digital systems!

Opinions expressed herein are my own and may not represent those of my employer.

Hi,

I remember there being a discussion about 'high power' FM transmitters that did not need an FCC license. When I say high power, I am thinking 0.5W/1W? Ramsey electronics rings a bell.

The situation I have is that I want to set up a transmitter in the fire house to rebroadcast our trunked radio system for the local members (and anyone else that wants to listen in). I am about 0.5 miles away and oviously would like to benefit from this venture!

What comments do people have? What would be the best and/or least intrusive way to interface with the fire radio itself? What kind of antenna would you suggest to achieve a 0.5 mile distance?

Thanks - Bryan.

Okay, here goes:

I'm considering buying a new scanner in a few months. I'm writing this to make an informed decision (hopefully). The Pro-60 I've got is OK, but hey, I'd like to have alphanumeric displays, more freq. slots, and of course CTCSS if possible. I'm leaning towards the BC9000xlt. I believe it's being sold (I saw it in some scanner magazine) for about $375 US dollars (Is this right??). But, maybe I don't know all there is to know about the AOR8000. Does it come with CTCSS, and what is it's list price (for a new one)? Any other info that can be provided on these two scanners would be greatly appreciated.
Thanks!

Bryan, First look into the rules about rebroadcasting your trunked system, even if your fire department owns it.

Second, Ramsey sells a number of kits. There is a news group called :

alt.radio.pirate

which is really into FM broadcasting. Ramsey electronics phone is:

1-800-446-2295

They sell the:

FM-25 - PLL transmitter, around 25 mW or less, for $129.95

FM-10A - $34.95 plus $14.95 for case plus $9.95 for power cube (Really a toy)

FM-100 - "Professional" FM stereo transmitter with 2 line inputs and a mic input. I have one of these units. $249.95

All are in kit form. They also sell a LPA-1 which is a 1 Watt amp, but this brings the project into the illegal category.

For an antenna, you can fashion a ground plane from an SO-239 chassis connector and coat hangers (cheapest), or get a professional FM broadcast antenna for about $109 from:

http://www.ldbrewer.com/fmkit.html

Hope this helps! Good luck!

The PRO-30 uses *two* sets of batteries. It uses convential
AA cells to power the audio, RF, and IF stages and uses small
"hearing aid" style batteries for memory backup. Make sure
you replace those batteries, too.

Panaxis Productions has just come out with the ACC100. It is an FCC
Certified FM transmitter (Yes, it has an FCC ID #). Comes fully
assembled with an antenna, case, and power adaptor. The price is
$195.00. Just take it out of the box and plug it in!
For more details, visit my web page at

http://www.rain.org/~dschmidt

I also have the Panaxis FMX FM transmitter in kit form as well. More
RF output (up to 200mW REAL RF output, stable PLL operation, set your
frequency with direct reading BCD switches. $120.00 in kit form
This kit too is listed on my web page.

Take care,

I don't know about the ce-232, but I've had the os-456 for over a year
now, and I just love it. Now if I could just find some good software
to go with it :-}

Sure, , , These are more or less generic.
HBD = Has Been Drinking
DWI = Driving While Intoxicated
DUI = Driving Under the Influence

May I suggest that if you are really interested in this kind of thing,
the book called "Monitoring America" is an excellent reference.

>all info greatly appreciated. thanks.

That's VERY good question. I suggest that you contact the Customs service at the airport from which you leave. Also, I think that I'd put the scanner in my hold baggage, rather than carry it on. BTW the U.S. Customs people have a form that you can fill out so that they don't charge you import tax on your scanner upon re-entry. Check it out.

What if your fire dept. still has a license for some 150Mhz frequency?
Lots of them do, and don't use the frequency anymore. In some places,
they rebroadcast trunked transmissions on these otherwise useless
frequency, just so that the public can listen in with scanners? Even the
cheapest scanner you can scrounge up will get this band.

Check the file-date, but mid-1994 as I recall.

> Now (for me anyway), how the hell does one "drop in" [to Works] one of
> the .txt freq. lists that is _not_ comma delineated? (Like the lists
> that appear on rec.radio.sacnner, etc.?
> Is cut and paste the only solution?

Cut & Paste is one solution; not the only. A better one, perhaps,
is to drop the *.TXT file into a good text editor, like TSE, or
QEDIT, etc, and use the editor's power to logically prepare and arrange
the data. Fer instance, if someone posts a file kind of like this:

```
Orange County Police Stations (by Sean Reigle@1:103/203); Update: VI

```

It is quick work to prepare a file like this. Do a series of
Search & Replace, Cut & Paste maneuvers as follows:

1. Replace ALL existing commas with semi-colons (in this case,
none, but if there were ANY, you'd want 'em replaced FIRST)

2. Replace all instances of ". " (period-space) with a comma
(This delineates each field without destroying the columns

```
Control 1 ..,Countywide Emergency .....,(Red) .....,460.025 .,103.5
Control 1 ..,OC Tactical & Mutual Aid .,(Orange-S) ,460.200 .,103.5
```

Control 1 ..,OC Tactical & Mutual Aid .,(Orange-N) ,460.400 .,103.5

3. Cut the Frequency column, including the right space, dot and
comma, and paste it to the far left:

460.025 .,Control 1 ..,Countywide Emergency .....,(Red) .....,103.5
460.200 .,Control 1 ..,OC Tactical & Mutual Aid .,(Orange-S) ,103.5
460.400 .,Control 1 ..,OC Tactical & Mutual Aid .,(Orange-N) ,103.5

4. Cut other columns as desired, including out to the first comma,
and paste where ever desired:

460.025 .,Countywide Emergency .....,(Red) .....,Control 1 ..,103.5
460.200 .,OC Tactical & Mutual Aid .,(Orange-S) ,Control 1 ..,103.5
460.400 .,OC Tactical & Mutual Aid .,(Orange-N) ,Control 1 ..,103.5

5. Replace all double periods, "..", with absolutely nothing!

460.025 .,Countywide Emergency .,(Red) .,Control 1 ,103.5
460.200 .,OC Tactical & Mutual Aid .,(Orange-S) ,Control 1 ,103.5
460.400 .,OC Tactical & Mutual Aid .,(Orange-N) ,Control 1 ,103.5

6. Replace all space-period-commas " .," with just a comma:

460.025,Countywide Emergency,(Red),Control 1 ,103.5
460.200,OC Tactical & Mutual Aid,(Orange-S) ,Control 1 ,103.5
460.400,OC Tactical & Mutual Aid,(Orange-N) ,Control 1 ,103.5

7. Replace all space-commas " ," with just a comma:

AND, YOU'RE DONE!

460.025,Countywide Emergency,(Red),Control 1,103.5
460.200,OC Tactical & Mutual Aid,(Orange-S),Control 1,103.5
460.400,OC Tactical & Mutual Aid,(Orange-N),Control 1,103.5
460.300,OC Police Information,(Purple),Control 1,103.5

Ok, now the thing is......no one posts in the same format. We SHOULD strive to develop and adhere to formats, but that is not likely to happen in this lifetime. So, the next best thing is to know your text editor, and the logic of making quick and dirty SEARCH/REPLACE/CUT/PASTE's and most files can be trimmed and pared to comma-delimited ASCII in short order. It took me MUCH longer to explain the above operations than to do it.

Wham-Bam-Thank-You Ma'am.

Then it's a piece of cake to "drop" the file into MS-WORKS or any
other database manager, for that matter.

> P.S. Good to see your professional input again.

I am glad and willing, within limits of time, resources, cost,
and space, and -=IF=-.........big IF.........the militant dissidents
leave me the hell alone....within limits of reason.

But......BIG "but".........I absolutely will not tolerate the kind
of hostile, aggressive, venomous, vile attacks that were launched on
me by Hugh Duff, Tim Pacan, John Mackey, Ron Katz, Dan Browning, and
perhaps others.

Disagreements and differences of opinion are NOT what I am talking about.
I won't quibble or knock religion, race, creed, and abstract concepts. I
will not stand for blatant misconceptions, errors, and foolishness in the
physics, technology, and applications of radio electronics, nor will I
accept degrading, slanderous, vile, and/or underhanded attacks. Call me
names, that's ok. I have already accepted "A" as my middle initial.

This is a technical forum where the laws of Physics must prevail for
the sake of the good of all, not to mention safety of life, limb,
and property. A certain degree of exactness is necessary for the
upward evolution of technology and any benefits we expect to derive.

Ohms Law is Current equals Voltage divided by Resistance, but if
someone tries to argue it's Current equals the product of Voltage and
Resistance, we're going to straighten out that serious error, because
if applied, people could damage their equipment or even burn the damn
house down.

On the other hand, this forum is not a body of engineers, technicians,
and mathematicians. Therefore, there is a gray zone between technical
purity and practical understanding and application.

For instance, I don't think it is necessary for the hobbyist to understand
the chemistry of nickle-cadmium cells, so long as he can comprehend and
apply a few conservative rules on their care and feeding.

If we are to err......let it always be on the side of conservatism.
For if we fall short of the mark, we might be able to get up and
continue with a bit of a course correction. If we overshoot the mark
and miss the target, there might not be a way back. THAT is what happens
when bridges collapse; buildings tumble; and Pinto gas tanks explode.

That said and done, it's FUN using a computer to enhance scanning, and
the use of a REAL database manager for frequency record keeping is
easy, accurate, more fun, and enables the user to easily share his
frequencies with others.

A Television Weather Person told me that at this time of year
meteors bombard the earth's atmosphere more than normal. I am not
really knowledgeable in astronomy but I think it happens every year
at this time. As a meteor passes through the air it does something to
it causing radio signals to reflect from it like a mirror, causing
this skip. Ham radio operators are known to work some wild skip
during meteor showers. I am not sure if the meteor has effect on
one of the layers in the ionosphere or this happens at much lower
level. If you look to the North you should SEE 20-30 per hour. Maybe
some DX'er can comment on this some more.

```
Another form of weird skip is "thermal ducting" this is
associated with changes in weather. What happens is signals are
trapped between two layers of air and eventually bounce out somewhere
greater then what a ground signal could travel.

I also many years ago learned this the hard way. I found better
results with a 1/4 wave VHF antenna (about a 19" wipe) then the
discone. I think the term is "Unitygain" being no gain at all!

bumologist@usa.pipeline.com(bumologist) wrote:

Henrik, might take a try with:
155.160 162.2
155.235 162.2
155.055 none
154.055 162.2
154.100 162.2 (I think this will be it)
154.540 162.2 (Boardwalk Security)

Lemme know whatcha find! John Noble

While I can't get real good reception, I've monitored this freq every once in a while over the past few years. There has only been a little activity that I could hear at my monitoring post.

It sounds like they work on antennas. I have heard them talk about receiving sites. Today I'm getting very clr comm and they are working on the "carrier" for whatever site they are at. (90hertz was mentioned and "phasing the number 2 transmitter")

I've also heard them talk about being on the 15th floor of their building and wonder where that might be and just what they are working on.

The best clue came when I heard them mention the "tower" in the past. My guess is it's a tower at an airport. A unit once ID'd as "JFK 36". Could these be techs working on transmitters at JFK airport in NY? (a tech was called on the radio by the "tower" as they called themself)

I also have DES use listed in my notes from a couple of years back. It wouldn't make sense to have these techs using it but then again they might be. I've found the FBI using freq's that normally were used by other agencies. Just a thought to keep in mind.

The freq is listed as a FAA channel. If you get a chance, try monitoring at night as they are a bit more active then. One person stated they would be busy tonight.

Thanks for any help on IDing the user.

From: riker2@ibm.net
Message-ID: <320be02e.32487643@news-s01.ca.us.ibm.net>
Source record: 227084

I was wondering if any of you electronics pros could help me with this one. I have the Pro 31 scanner and was wondering if it can somehow be modified to receive aircraft frequencies, etc?
Right now it gets the following:

30-54 mhz
138-174mhz
380-512mhz

I have heard of people making mods that will enable it to receive in other ranges. Is this true or just myth.
Any help you may have would be greatly appreciated as well as a model that will receive these frequencies for a novice to use.
I basically want to be able to get aircraft transmissions near our local airport.
Thanks in advance,
Robert Rike

>>|Andy

I think the idea in so far as enforceability is concerned is so the powers-that-be can have one more thing to hang over your head just in case you do something to displease them.

I am not completely prepared to debate this, nor do I think this is the proper forum(s) to do so in, but I have come to the conclusion that the government has decided that the normal legal / legislative process has become ineffective in dealing with the issues (read: percieved *threats*)

Our politicians spend so much time preening and posturing before the American people, rather than dealing with substantiative issues, that the entire political process has become more of a circus side show, than an exercise in effective government. I am not altogether convinced that the people we elect to office are even qualified to understand the issues, much less deal with them.

So they sidestep the whole issue by creating a multitude of agencies with administrative (read dictatorial) authority over just about every aspect of our lives. These agencies rule by fiat, and in many cases are not accountable to anybody. (Canonical example: The I.R.S.) There are so many rules and regulations, so haphazardly written, and in some cases, mutually contradictory, that I suspect that no matter what you do, you are going to be in violation or one or more. Period. This sets the stage for selective enforcement, which means that if you attract thier (agency) attention, you get stomped on.

This flap over environmental impact statements is just another example of a government spinning wildly out of control.

Unfortunately, I am not a politician, just a humble electronics enthusiast, so what can I do?

I don't really know anything about the pro 31 but, the frequency
ranges indicate that it is only a FM mode receiver. Even if you could
modify it to cover the aircraft band I doubt it would contain the
circuits necessary to receive AM signals. Aircrafts use Amplitue
Modulated Signals unlike the Frequency Modulated signals that most
scanners are designed for. Most scanners on the market these days
have AM,FM and wide band FM some maybe even SSB. On the
PRO 2004,2005,and 2006 this is selectable. On some other scanners this
is switched automaticly.

As for other mods for the pro31 I can not help you here.

You just need to add a 3 conductor sub-mini or mini stereo jack to the side of the 8000. Just connect ground, tip and ring and bypass the flat-flexi connector altogether. I did this by soldering data leads from the flat flexi cable contact points to the stereo jack. Now I can use my scout with the 8000 and a single stereo cable. This arrangement also allows me to use the scout with the Opto CX-12 or Opto Lynx. I don't have to take off the battery pack.. just plug the stereo cable into the side of the scanner and go.

Woodman posted gibberish, and then told everyone to get a clue. I merely pointed out that he obviously lacked expertise in this particular area. Now he's upset because I told him that if he was an emperor, we would be buck naked. I can assure you, it is not a pretty sight!

LGS

Yoiu must be near an airport. 172.825 is a frequency used by the FAA and
you're hearing their techs working on system components.

Try going down a road that you can kill the ignition while rolling at about 30 MPH - if you still hear the noise with the ignition of the vehicle off, then it may be wheel bearings or a host of other sources. If it dies, then it's a motor-drived noise source.

1019. Re: NJ North/South Star Lifeflite heli freq's needed

Yes...155.295 is probably the best freq to monitor. They are based in Morristown and they have full VHF / UHF freq coordination capability, so they will be advised, when airborne, about what freq to communicate to locally for landing zone
instructions. It's quite a bird, if you ever get a chanece to see it operate, you should. They do tarining sessions for local FD, PD, and first aid squads on occassion so that theose folks know how to set up a LZ, when to call Northstar, etc.

The spray helps to shield RFI, but what about the antenna ? The best way to shield for RF is to try and distance the reciever from the source of the RF, so try and move either the PC, if that's causing the RF, or move the scanner.

supposed to be a place in alaska that had to dump fishing waste into a stream upstream of a water treatment plant so it could be shown that the addition of the waste treatment plant water would improve the water's quality (had to do with EPA rule requiring treatment plant to improve water quality x%, without taking into account the initial condition of the water or what the water would be like if the treatment plant were not there....). anyone got the exact info on this one?

actually, wouldn't a TV antenna work for 6 and 220 without too much effort?
and 2m might just work on an LP type antenna...will have to see if it's possible
to do some measurements....wouldn't expect there to be too much modification
needed for the use of an existing TV antenna as a transmitting antenna in
the amateur service -- short of adding a balun (6:1 for 300:50 transformation) and
maybe doing some minor changes to the element lengths.

John,

No, I do not know about these particular incidents. I am also not
painting Mr. Cheek as Jesus Christ. I don't know him except what I've read
on
FIDO awhile back and the Internet now. I do, although, see that you have a

specific agenda against this man.

Try this out - If your best friend made a mistake (harmless, not murder - you
get the idea) would you say "go to hell" or "man, you screwed up, lets go get
a beer."

If the point here is a pissing contest, I usually piss an average distance.

;-) If the point is to share information and become more knowledgeable, then
again I'd have to advise not to take certain sentences personally. Take in

all information, filter out the crap, and get on with your hobby. Sort of
like watching the NEWS.

I don't doubt any of your points. I don't have all the facts. But I do know
that I have learned quite a bit from Bill Cheek and hope to learn more. That
said, refer back to last paragraph. The point is "Opinions are like assholes,
and everyone has one. Me included.

Have a great evening!

Dave

1025. Re: Any NJ freqs?

Using the example info that Bill used, I would use MS Word, WordPerfect, or a decent word processer I would replace the elipses (...) with TABS, as well as any other column seperator. This allows one to see that the data is properly seperated so that when the data is imported into a database manager such as FileMaker, Access, or FoxPro you won't end up with text in the frequency field etc....

In an example as this, I would replace the "....." with tabs in decending values, so I would replace first a whole bunch of "............." and subtract a "." each time until I get down to 2. Since the decimal point is used in this example, I would have to viualize the results after that and replace any stray single decimal points manually.

Once I get this into a Tab seperated format, I can look at the data to check the fields for errors in format or seperation. I then would import this into (in my case) Filemaker. Filemaker, BTW, has a neat ability to create a standardized layout when a text, .dbf, or other file is dropped on it, and will automaticly create a file when this is done.

I prefer Tab files since they are very easy to work with. Since most database managers allow you to export TO a tab file, you can use this as a data transfer format. Lets say you use DataManager, which does not support .dbf, and you want to share your data with your buddy who uses TurtleFile. Since both imaginary programs can read from tab files, just use that format.

Tab Files can also be imported into spreadsheets, read by the lowliest text readers, and can be transferred to different platforms (Mac, Dos, Amiga, etc...)

If you try to read comma files in a word processor, you end up with:

"Control 1,Countywide Emergency,(Red),460.025,103.5"

If you used tabs instead you would end up with:

"Control 1 Countywide Emergency (Red) 460.025 103.5"

Since most good word processors allow you to adjust the tab points, you can align your columns to allow all your data to line up well.

The above procedures have served me well in my books and newsletters, but ither options are out there. I prefer this way, Bill likes comma text, and you might like something totally different...

If there was a "Standard" Rec.Radio.Scanner format I would vote for Tab Text since it appears to be the most universally usable format.

wrote:

** Cut & Paste is one solution; not the only. A better one, perhaps,
** is to drop the *.TXT file into a good text editor, like TSE, or
** QEDIT, etc, and use the editor's power to logically prepare and arrange
** the data. Fer instance, if someone posts a file kind of like this:
**
** Orange County Police Stations (by Sean Reigle@1:103/203); Update: VI
** Control 1 ... Countywide Emergency ..... (Red) ..... 460.025 .. 103.5
** Control 1 ... OC Tactical & Mutual Aid .. (Orange-S) . 460.200 .. 103.5
** Control 1 ... OC Tactical & Mutual Aid .. (Orange-N) . 460.400 .. 103.5
** Control 1 ... OC Police Information ..... (Purple) ... 460.300 .. 103.5
** Control 1 ... OC Car to Car Task Force .. (Blue) ..... 460.500 .. 103.5
.....

** It is quick work to prepare a file like this. Do a series of
** Search & Replace, Cut & Paste maneuvers as follows:
**
** 1. Replace ALL existing commas with semi-colons (in this case,
** none, but if there were ANY, you'd want 'em replaced FIRST)
**
** 2. Replace all instances of ". " (period-space) with a comma
** (This delineates each field without destroying the columns
**
** Control 1 .,Countywide Emergency .....,(Red) .....,460.025 .,103.5
** Control 1 .,OC Tactical & Mutual Aid .,(Orange-S) ,460.200 .,103.5
** Control 1 .,OC Tactical & Mutual Aid .,(Orange-N) ,460.400 .,103.5
**
** 3. Cut the Frequency column, including the right space, dot and
** comma, and paste it to the far left:
**
** 460.025 .,Control 1 .,Countywide Emergency .....,(Red) .....,103.5
** 460.200 .,Control 1 .,OC Tactical & Mutual Aid .,(Orange-S) ,103.5
** 460.400 .,Control 1 .,OC Tactical & Mutual Aid .,(Orange-N) ,103.5
**
** 4. Cut other columns as desired, including out to the first comma,
** and paste where ever desired:
**
** 460.025 .,Countywide Emergency .....,(Red) .....,Control 1 .,103.5
** 460.200 .,OC Tactical & Mutual Aid .,(Orange-S) ,Control 1 .,103.5
** 460.400 .,OC Tactical & Mutual Aid .,(Orange-N) ,Control 1 .,103.5
**
** 5. Replace all double periods, "..", with absolutely nothing!
**
** 460.025 .,Countywide Emergency .,(Red) .,Control 1 ,103.5
** 460.200 .,OC Tactical & Mutual Aid .,(Orange-S) ,Control 1 ,103.5
** 460.400 .,OC Tactical & Mutual Aid .,(Orange-N) ,Control 1 ,103.5
**
** 6. Replace all space-period-commas " ," with just a comma:

```
**
** 460.025,Countywide Emergency,(Red),Control 1 ,103.5
** 460.200,OC Tactical & Mutual Aid,(Orange-S) ,Control 1 ,103.5
** 460.400,OC Tactical & Mutual Aid,(Orange-N) ,Control 1 ,103.5
**
** 7. Replace all space-commas " ," with just a comma:
**
** AND, YOU'RE DONE!
**
** 460.025,Countywide Emergency,(Red),Control 1,103.5
** 460.200,OC Tactical & Mutual Aid,(Orange-S),Control 1,103.5
** 460.400,OC Tactical & Mutual Aid,(Orange-N),Control 1,103.5
** ....

**
** Ok, now the thing is......no one posts in the same format. We
** SHOULD strive to develop and adhere to formats, but that is not
** likely to happen in this lifetime. So, the next best thing is to
** know your text editor, and the logic of making quick and dirty
** SEARCH/REPLACE/CUT/PASTE's and most files can be trimmed and pared
** to comma-delimited ASCII in short order. It took me MUCH longer
** to explain the above operations than to do it.
**
** Wham-Bam-Thank-You Ma'am.
**
** Then it's a piece of cake to "drop" the file into MS-WORKS or any
** other database manager, for that matter.
** ...

Yes, it's obviously a joke. Not only is the USS Missouri NOT an aircraft carrier, but U.S. Warships use GPS systems for navigation. It would be next to impossible to run a carrier into a lighthouse.

Cool post though :)

Best way to find out is to go to your local airport and visit one of the
flight shops. Or pick up a magazine (Aviation Weekley, etc...)

Dont know about the ce-232, heres my solution:
PROBE 2.0 + OS 456 + PRO 2006 = good value/performance.

The power required to go a half mile will probably be much more than the
legal limit for unlicensed transmitter. And there is another concern.
The communication you want to rebroadcast is not a broadcast in the first
place, it is protected by privacy laws. Broadcasting it may be in
violation of these laws.

Here are several web sites with frequency lists for Ventura County, Santa Barbara County, San Luis, Monterey and Santa Cruz Counties. Nothing so far for San Benito County.

I live in Santa Barbara and can attest to the accuracy of that list even if it was compiled in '94.

http://www.echo.com/~garlick/scanner.html Santa Cruz County with some Monterey.

http://gate.cruzio.com/~mendosa/sancruz.html This covers Santa Cruz County and has the link to Rick Mendosa's list of Santa Barbara and Ventura Counties. Very good on South SB County and Ventura area.

http://www.slonet.org/~etreankl/freqs-sm.html This covers Northern SB County and San Luis Obispo County.

That's all well and good, Aaron....and something like that MIGHT help a green-weeny computist and novice scannist get himself bootstrapped off the ground. But those kinds of programs are dead-ended and go nowhere in terms of keeping pace with the user as he grows. They are hard as hell to export data from and import data into, and to expand or tailor for custom needs.

You're basically stuck with what the programmer thinks you need and want, and that's that. But a simple, easy-to-use database manager like the one in MS WORKS grows as you want and need. Not only that, but you can use it for a hundred other things besides freqs. There is just hardly any solid use for those old dedicated freq data managers anymore. This is the day and age of high power computing.

Like one minute, I am running a manufacturing plant from my PC; the next minute, a publishing company and press; and the next, a design engineering lab. My data needs to flow from one point to another without anyone else but ME deciding WHERE, WHEN, HOW MUCH, etc.

Now there ain't nuthin wrong with a program like you mentioned, for those who can't make anything else work, but those puppies have pretty much seen better days.

<Mileages may vary, of course>

Bravissimo for you, then! It's awful hard to peg how easy something
will be for someone else. I had used AppleWorks integrated software
on my Apple IIe computers for several years before I took the plunge
into PC's in '91 and latched onto MS WORKS at that time.

For me, WORKS came easy because the database manager in AppleWorks was
vaguely similar......and "vaguely" in databases means MUCH. :-) I
had more trouble with WORKS' word processor than the spreadsheet or
database.

Nowadays I use MS ACCESS for my main database manager, but you know
what?
MS WORKS remains the front end for most everything I do. I mean, I'll
grab a freq or other data file from somewhere; process it in WORKS
first, and then export it to ACCESS when it's good and ready.

WORKS is sort of like a 6" Crescent wrench; a 6" set of flat and cross
point scewdrivers; an allen wrench set; and a pair of pliers. You
just stick 'em in pocket and forget they're there until you need 'em;
then use the hell out of 'em. Nooooooo, nothing beats a 5-ft high
Craftsman tool cart loaded for bear....but.....

I am in a county still hung with 46 meg fire frequency, had a very inexpensive antenna that I got from Santa Fe dist. very similar to Grove, cheaper yet, and lost it from a tree limb falling, put up the RS discone, Terrible on low band until I added a verticle element to the top stud, which helped some. Still not as good as the old cheapy, which I intend to replace before winter. Have seen other 'cones with the verticle element, but they are pretty pricey.

I checked with the local country club, and they said you'd definitely need balls if you're going to have a golf war. They even sell golf balls in their pro shop. However, they do not permit the use of tanks on the course due to the amount of damage which they would cause to the greens. Instead, they recommend the use of small vehicles known as "golf carts," which are not only better suited to terrain typically encountered on fairways, but also have a much lower noise level than tanks.

I just did a review of PROBE for the CARMA Newsletter. I really liked
this program, and it was much better than ScanStar or Radio Manager,
IMHO. If you have a Mac, then WAVE is the way to go.

Probe is designed for the OS456/OS535 only, while ScanStar will run
several different radios. Wave is also OS456/OS535 specific as well.

From: mick16@erols.com
Message-ID: <320d6749.21040920@news>
Source record: 226930

To all:
I have a BC 200 XLT (1994 model I think) and a Radio Shack Multi Purpose Scanner Antenna. I put up the antenna when I got the scanner, 1994, so I can't remember the model or part #. Its a pretty big one..About 9 feet across at the bottom and its a christmas tree style. As you can probably tell by my terminology I'm an amateur. But, any way, I was wondering if this antenna is worth a crap ?? I'm pretty sure it is supposed to cover all the bands. Also, it is mounted on my roof. I attached it to the same pole as my TV antenna. Is that a no-no ?? I remember the directions saying something about not sharing the mounting pole with other antennas?? But that was the only thing I had to mount it to. One more question.. The reception doesn't seem to be that bad..But what can I do to TWEAK it. It unfortunately doesn't rotate..Does that help? How far (in miles) do you think it can pick up frequencies?? Thanks for any and all replies and help !! Thanks again,
Mick

The "ball" on the end of the antenna also acts as a capacitor
improving the antennas bandwidth, this is known as a capacitive hat

One of the few I still found with the l201 mod. Its about 8mo old.
Have all docs, mobil mount (possible still have box).
Full Cell.
100 ch.

$150 + shipping FIRM.

Hi, Bob:

I'm running a RS discone in my attic attached to my Pro-2006 by about 25' of RG-6(SAT) cable and it works pretty well.

Low band reception will suffer due to the RS antenna's lack of a vertical element that other discones, like the Icom or Diamond have.

Bill Cheek, in his first book, has a neat mod to add a cheap mobile CB base loaded antenna to the top of the RS discone. You might want to consider that, but if you have an attic like mine, you won't have the height.

Keep in mind that a discone's primary advantage is to give you as wide a frequency range as possible (25-1500 Mhz). In order to do that, the antenna has no gain.

If you are also interested in other frequency ranges, you might try the discone and see how it does on low band. It might be fine. You can always make a homebrew dipole for low band.

Jim, I am in California also. I travel from southern California to
northern California quite often. From Lake County in Northern California
to San Diego on the south. I've been in the mtns and canyons of Angeles
Nat'l Forest and also San Bernadino Forest. Napa County and Lake County
has some nice RF holes! It also works nicely in
hospitals. I am also on ProNet Medical Paging systems, which works great
w/i hospitals (never miss a page). On the FLEX pager, I have missed
pages in the basement and several x-ray rooms.. but that is expected.

>discone. I think the term is "Unitygain" being no gain at all!

That's pretty much what 0-dB gain means. Trouble is that discones aren't all that "flat" in their performance, and so gain can dip into the negative numbers. A discone with the vertical low-band whip might show some positive gain on the low end, but otherwise, you're looking at wideband and no gain. Goes with the turf.

Gain is a misnomer or hard-to-understand concept. But the meaning is always with respect to something else. There are no absolutes associted with gain. The two prevailing standards for antenna gain are "isotropic" (dBi) and "dipole" (dBd).

An isotropic radiator is a theoretical point source of no dimension, used to comprise the assumption model of a unity (0-dB) gain antenna. The wavefront is considered to be a sphere, the intensity of any point on which is equal to the intensity at all other points on the surface of that sphere. There is no such thing as an isotropic source; it is just an imaginary model for 0-dB gain reference.

The real model is a standard dipole, which has a gain of 2.15 dBi or 0 dBd (with respect to itself). This gain is achieved by virtue of the dipole's radiation pattern vaguely resembling a doughnut with the line of the elements passing through the "hole". Maximum gain or radiation intensity of the wave would be perpendicular to the feedpoint of the dipole around a 360-degree azimuth. Gain falls off above and below that circular plane to minimum off the ends of the dipole. "Minimum" is not necessary zero signal nor even 0-dBi. It's just "mimimal" off the ends and maximal (2.15-dBi) perpendicular to the elements.

Discones are more or less a combination of bent, off-center-fed-dipoles. Their gain averages 0-dBi or less,across a bandwidth of six to eight octaves above the designed cutoff. At any given frequency, gain can actually be "negative" or less than the isotropic reference. That doesn't mean a loss; it just means less than isotropic.

Therefore, a "whip" antenna, even designed for VHF (3-dBi gain) will outperform the discone over a fair chunk of the spectrum. Not all, though. Just some.

Huh? Think about it. If that were true, then there would
be no need for the special classification of "restricted"
orifices. Actually, it's ANY other orifice where flow is
directly proportional to the pressure drop across it.
The flow through a restricted orifice reaches max volume with
only a LITTLE pressure drop and any further increase in
pressure results in little or no increase in flow. THAT is the
purpose of a restricted orifice !!

Calibrated restricted orifices are used to establish standard
flows that don't vary with varying pressures. Kind of like
zener diodes a little.

Actually I'm an apprentice at scanners. I used restricted
orifices in gas chromatography years ago....possibly before
you were born, or when you were scooting around in 3-corner
shorts, maybe.

Working events (like football) there isn't much going on the radio anyways. PD would talk about arresting people who under the influece of drugs and responding to "disturbances." As a medic, we are told if there is a person who needs medical attention and the closest teams of medics would respond or if we are flagged down then we would inform our CP that we are not available for a call. And yes, we do have "move-ups" we there are holes that need to be covered.. If more man power is needed, you'll hear that too. "Radio runs" are NOT found on this freqs. for the event.

>some suggestions to me. Thanks for your comments bill.

Nothing is truely a waste of time, , , , , , You know, busy hands and
all that :-}
I just can't see the problem. I use MS Works to record my database,
but I use a spread sheet instead of the wdb. This is my master list
of all frequencies in the area.

I then program Scan*Star the way I want it. As an example, I do not
want all 300 frequencies in the machine at the same time ! I want
them to be in rationally related sets. I run a PRO-2030 next to my
2006/456 which has representitive samples of various frequency sets.
When I hear something happening on the Fire freqs, as an example, I
just select that complete set on the 2006.

Works for me!

What were you looking to can, greenbeans or 'maters?? :)
Seriously though,
If you can find a Radio Shack Pro-23, date code 2A4 it would be a
great place to start. 50 channel handheld, cellular modifiable.
I paid around $199 for mine new a few years back.
I don't know if the current pro-23's are modifiable, but if they are
that would be a reasonable route to take.
Just my opinion though...

Your views are not the same as those I can find in my physics
textbooks. Would you like me to furnish references so that you can write
to the authors and point out their errors?

AFAIKT, different sized calibrated orifices are used to establish
different calibrated flow rates, but that only works if the pressure is a
constant. If you change the pressure on any sized orifice, the flow rate
will change. Not like a zener diode at all. More like a resistor.

My Pro-43 died yesterday (no audio), & I need to replace it this week. I'm going to the NASCAR race the 18th I need one to use there. Due to the time constraints, I'm probably restricted to Uniden & RS. I'd like something comparable to the 43 in capabilities. Any advice as to specific models will be appreciated as I haven't kept up with the newer models as well as I should. The 43 WILL be repaired, there just isn't time to get it done right now. Also, I did consider renting at the track, but the time required to return it would add 3 - 4 hours to the time needed to get out of the parking lot (if you've ever been to a NASACR race you'll know what I mean).

Thanks much

Because of a purchase of a new scanner, I will have to sell my 900MHZ converter. It is a GRE 9001. You hook the unit between your scanner and antenna, then scan in the 400MHZ range. To power the unit you need a 9-volt battery or a power supply. I dont have the manual anymore but if you have police frequencies in 800 MHZ range you can figure out where to look for what. $15 would take it plus UPS so lets figure an even $20 unless you live in the Milwaukee area and can pick it up. E-mail me for even MORE information.

1080. Case for CE-232 External Installation

Newsgroup: rec.radio.scanner
Date: 1996-08-11 00:00:00 UTC
From: jlozvold@spectra.net
Message-ID: <4unb4b$bhv@ns2.spectra.net>
Source record: 226953

I just picked up a CE-232 computer interface because the price was reduced. Having decided to do an external installation, the challenge is to come up with a simple and inexpensive way to do it. I came upon the idea of using an external 1200 baud modem case. I picked it up at a hamfest for $1.00. The old external modems, 1200 and 2400 baud, already are in a nice case, thay have the DB25 connector notched out on the back and the have LEDs wired in to use as a power on indicator. The only real work involved enlarging a phone style connector so that it would accept a DB9 connector. That took me 3 minutes. It really worked out great and it looks natural next to the computer.
Oh yeah, by the way, the CE-232 interface worked perfectly the first time I powered it on. It comes with a complete, full function programming package that you do NOT have to pay extra for, like the OS456 that I have sitting in the corner.

1082. Speed Loader?

Newsgroup: rec.radio.scanner
Date: 1996-08-11 00:00:00 UTC
From: malex007@aol.com
Message-ID: <4ukp5i$c2s@newsbf02.news.aol.com>
Source record: 226955

An earlier post mentioned some sort of "speed loader," which apparently can be used to autoprogram a PRO2006. This device is not the Commtronics CE232 as far as I can tell (which is autoprogram)but rather seemed to be something that worked with the Opto 456. When I queried the person who mentioned it, he didn't know anything about it other than the name. I tried a web search and found a single site (devoted to the PRO2006) that mentions "speed loader," but that site has not been up for at least 10 days (yrka.somethingortheother).

Anyone ever hear of a "speed loader?" If so, what does it do? Who makes it?

Appreciate whatever insight you can shed on this.

>Your perception will be different.

Actually,I thought that article was very well written indeed.. I
think I read the same thing back in 1952. He is correct that the
balls do help reduce static electricity. Don't forget we are talking
about an antenna which is ABOVE ground. (I don't means "physically",
but rather "electrically".) The sharp points on other parts of a
vehicle also have their unique problems, but in this case, he was
talking about ANTENNAS.

As far as aircraft are concerned, the same problems occur, except
they are somewhat different. Most low speed civil aircraft have
several small pieces of what appear to be cotton string on the
trailing edges of the ailerons. These are static electricity
diffusers.

High speed jets, go too fast for the static electricity to catch up
with them :-^}

Hi, Bob:

I had a RS discone, and quickly replaced it with one of the ICOM discones. I think the vertical element will fit in your attic. The low band does suffer without the vertical element. The unit is a bit pricey(around $105), but with the ICOM you get 50 feet of coax with type "N" connectors. Essentially, That unit and an adaptor from Radio Shack (Type "N" female to BNC male) will constitute an entire antenna system. It is very well constructed, and has held up well.

Hope this helps!

Mark,
Ron is correct. Speaking as an avionic systems technician, military aircraft have static dischargers located on the trailing edges of each wing and stabilizer (which are little pointed needles facing perpendicular into the airflow) to discharge static build-up BEFORE the radio antennas do. An early change to the AWACS comm antennas was to add a "beaded" edge to the bottom of the blade antenna to reduce "static light off" which has a tendency to trash the multicoupler connected to it. Yes, car radios are connected to the chassis ground but the active antenna element is NOT (that's where the 75 ohm impedance comes from).

Looking for a reasonably priced simple scanner to use to pass
the time while in the car.

I saw a cool looking small unit that was non programmable, but
claims to have "all police etc" frequencies preprogrammed in it.
All you do is indicate the state you're in. It was VERY small, like
a big radar detector and I like that.

Any suggestions?

According to the Uniden/Bearcat 200/205XLT Service Information Manual,
the
following procedure will load channels 1-25 with various test
frequencies, and
zero the remaining 175 channels:

1. Press and hold three keys: 2, 9, and MAN simul-taneously and turn
the power switch on.

2. Set the power switch to the off position.

3. Repress and again hold three keys: 2, 9, and SCAN simultaneously
and
turn the power switch on.

I used an old Nuvo Link Box. This Device was used to convert Apple Talk Printers into Ether Talk Printers. It has a DB15 and a BNC connector on the back.
I added a DB 25 connector and used the DB15 to a DB9 for the computer connection. Best of all is that it also had a LED Bar Graph in the front panel. I mounted the CE-232 inside and I will be building the LED Bargraph SWR meter soon and mounting it in the box as well. I also have a Pro-43. I will be using this to programm my pro-43 as well.

Anthony:

I don't think you're going to get one mile range from 100-MW...1-Watt
maybe. 100-MW will usually go about 1/4 mile.

The other consideration is the band, or frequency the unit operates on.
Some of these units are on business band, and restricted for that use,
and require a license. Others may be on the GMRS band, etc.

If it's the business band you want, check out the Motorola Radius units.
If you want them for personal use, check out units in the GMRS band,
Radio Shack has one, Maxon and Uniden also have units in this band.

A general rule of thumb, without using a repeater, you will average one
mile, per watt. i.e.: 2-Watts, 2-Miles, etc.

Bill,
I would add that if going with commercial freq's, be sure to get either

Tone Squelch (most common) or Digital Squelch. These are silent tones carried on the wave, that opens the speaker only to like toned radios. This way you won't have to listen to Fred's Plumbing talking about the stopped up shitter at Mrs. Jones'. JN

If you like.

But we're probably not stepping to the same drummer here. You are
thinking one thing of a general nature while my frame of reference is
more specific and exacting.

> AFAIKT, different sized calibrated orifices are used to establish
>different calibrated flow rates, but that only works if the pressure is a
>constant. If you change the pressure on any sized orifice, the flow rate
>*will* change. Not like a zener diode at all. More like a resistor.

Then what is the difference between a "restricted orifice" and
an "orifice"? According to you, nothing. So pursue your studies
in that vein and you will see where very tiny orifices take on
unique properties relative to the liquids or gases that pass
through them.

Liquids, especially, have different properties than electron
flow, because of surface tension, molecular adhesion, et al,
which, under certain pressures behind a "restricted orifice"
most definitely do not result in a substantially changed flow. This
property is well known (and utilized) in chemical engineering,
especially in precision air pollution instrumentation where calibrated
flows are required to set baselines for mixing or relation to other
substances.

The molecular adhesion and surface tension of water, for instance,
are constants. When water passes through a larger orifice, these

factors are tiny parts of the equation. As the orifice becomes smaller (i.e., restricted), then those constants become a significant quantity in the pressure vs flow analysis, and the properties most definitely change at that point, ala the "knee"..

Let's put it this way, then: restricted orifices are very predictable with respect to flow versus pressure, and there is a "knee" in their curve, where above the knee, the change in pressure results in little or no additional flow.

This varies not only by the orifice, but also by the substance that passes through the orifice.

Diodes are said to have a constant voltage drop above the forward bias point. True.....except that as current through a silicon diode increases, so does the forward bias....out in the 2nd and 3rd decimal places. Constant voltage drop? Well....you tell me, then. It would seem contradictory....

Perhaps you are being equally literal with respect to restricted orifices?

> Brian Petersen
> brpeter@ix.netcom.com

I have the same problem with my YUPITERU MTV7100 and a Skipmaster Royal 1300 discone (25-1300MHz). The problem is RF-overload in combination with a lack of selectivity of the receiver and antenna (both broad-band).
You can solve this problem in "many" ways:
- use narrow-band antenna's;
- use a switchable attenuator between the discone and the scanner (see the latest ARRL antenna book)
- indeed use (construct) a set of (passive) filters: High-pass, Band-pass and Band-reject; Band-pass filters seem to be the most effective, but the others will do depending on frequencies, band-with, signal-strength of the unwanted stations, etc.

Combinations of filters (or filters with a attenuator) is possible.

hello
Im about to buy a bc200xlt scanner for 165 dollars flat, is that a good deal??? Also, I already know how to mod it to pick up the full 800 range, but is there a way I can connect it to my computer, if there is where can I get software for it? Also, in reply to the dtmf decoders, I've heard that all you have to do is record it, then play the tones through your phone onto your friends pager, and the pager should recognize it and show the #'s.
Please E-mail me if you have any answers or suggestions.

Tha antenna is a discone (which is discussed often here). Generally a
very good all purpose antenna, although lacking somewhat in the low
VHF range (25-50 MHz). Rotation is not needed, the antenna is
omni-directional, but the reception pattern will be influenced by any
metal in its vicinity (the tower). Your range is not predictable
without knowing a whole lot more about your set-up, but as a point of
reference, I have the same antenna mounted about 40' off the ground,
RG6 cable, and a PRO2006. I can recieve 150-200 miles if I want to,
although I rarely do.

Thanks Steve, I knew that about the avionics, just one of those damn
brain farts.

Regarding the car antenna, I also realize the antenna is not directly
grounded, but I also suspect the antenna to ground resistance via the
radio and vehicle is magnatudes less then via free air.

Mark

The truth as I perceive it to be.
Your perception will be different.

>Thx for any info.
>gisela angelina
It depends on what type of scrambleing they're useing. if the
broadcast sounds like garbled alien speech, it's probably speech
inversion, and yes there are descramblers available for this fairly
cheaply.
If the broadcast sounds like a bunch of white noise (as in an AM radio
not tuned to a station), it's probably DES (digital encryption) which,
as of today at least, cannot be decoded, primarily because the
code/decode scheme can be altered to any one of a zillion
possibilities remotely.

Mark

The truth as I perceive it to be.

The Ham Radio Online web is still "on the air." However, our new web server located in California's Silicon Valley lost power during the massive west coast power outage this weekend and as of Sunday morning (U.S.) 11 August the http web server is still not functioning. Our ftp access to the web site came back up this morning so we've updated the files. We assume the web server will be brought back online by Monday.

You can access the Ham Radio Online web site at:
http://206.13.40.11/
(www.hamradio-online.com when InterNIC gets their directory updated.) You can also check for updates at our backup web address:
http://www.accessone.com/~vbook/hronline.htm

We've completely redesigned the "List of Other Ham Radio web sites", "Commercial Products Directory" and the Ham Radio Online Library for easier access to all the information that is stored online. It really looks cool and we had a lot of fun learning how to use "frames" for the web pages.

Thanks!

I feel that rec.radio.scanner.freq would be an EXCELLENT Newsgroup (it would certainly prove to be more worthwhile than some newsgroups we have all seen!!). As Roger asked... How does one go about adding another newsgroup?

(I live in San Diego where the Republican Convention is currently taking place. Should I goes ask them for their input on starting up this newsgroup??)

Speedometer static noise used to be relatively common in *the olden days* :-} It was a tough one to diagnose, but it is a valid question. What happens is that the grease in the cable drys out and then you get all sorts of problems.

> HT, except for hams.

Channels on radios are whatever and wherever the person who set-up the radio has decided where they are going to be. The local FD here has their Ch 1. on a higher frequency than their channel 2. They should be too far apart as then they start running into tech problems having to do with the tuning coils etc in the radio. Ch 2. in your case may be higher... You may want to even ask if anyone knows the exact freq you are looking for. Just put something like Subject: Toronto, somebody ch 2. freq. Look to see if the TorFreeNet has a local scanner sig, as local folks will probably know

I was killing an hour before a flight at John Wayne Airport in Orange County.Pulled out my Pro39 and monitored 120s (flight control tower). After boarding the plane, I was pulled off the plane and surrounded by three security people in the ramp area. They told me there were complaints by other passengers that I was a "suspicious character" listening to a radio in the terminal. I assured them I was just a regular guy listening to a scanner. They told me to get back on the plane, sit down, and not move around. And this was BEFORE the TWA incident. My advice, especially in light of the recent scares, is to keep your scanners in your carry-ons, get the highest hotel room you can upon arrival at your destination, and do your scanning away from the airport terminals and cabins of planes. By the way, a mag-,mount antennea stuck to the hotel airconditioning vent makes for a nice travel rig.

DS>A friend just purchased a new Sportcat (SC150). He tells me that he can
DS>pick up cell calls with no mods. He went on to explain that he is
DS>actually receiving an image of the cell call. What is an image and is
DS>this a good way to monitor cell calls?

[short technical lecture]

99+% of all receivers everywhere are superheterodynes. They mix or heterodyne an incoming 'air' frequency with a local oscillator ('LO' for short) frequency. This non-linear mixing produces two more signals, one at the sum of the air and LO frequencies, the other at the difference. One of those goes to the intermediate frequency ('IF') amplifiers while the other is filtered out. That other signal is the 'image.' Modulation on those two mix products is the same.

If you know the LO frequency and the IF you can find the incoming air frequency and its image by simple arithmetic. Suppose you want to receive 200 MHz and the IF is 20 MHz; the LO should be at either 220 MHz or 180 MHz to get the mix product of 20 MHz. Let's say the LO is 'on the high side' of the signal at 220 MHz. In that case, the image is 220 + 20 = 240 MHz; the desired signal is the difference while the image is the sum. If the LO was at 180 MHz, the image is 180 - 20 = 160 MHz; the desired signal is the sum while the image is the difference.

Whether or not an image frequency can be received at the same strength as a desired frequency gets more complicated and involves other circuits, namely the filtering between antenna input and the mixer circuit. That filtering depends on the receiver design...which in turn determines the relative strength of desired frequency versus image frequency. There's a lot more on superhets and mix products but this short message ought to give you a general background. I hope it helped.

1139. AR8000 AM filter mod

Newsgroup: rec.radio.scanner
Date: 1996-08-12 00:00:00 UTC
From: klimasewski@fccvde.enet.dec.com
Message-ID: <4uo88h$egt@mrnews.mro.dec.com>
Source record: 226763

I have designed a switching scheme that allows the user to select
the stock 12KHz AM filter or the narrow SSB 4.0KHz while still in
the AM mode. I have found this to make a BIG difference when trying
to receive a weak shortwave station next to a very strong one.
The only part required is a switch and some wire.
My mod has no effect on the use of the DS8000 speech inversion accessory.

Send me email if interested.

1140. Dying Pro-2004, Help?

Newsgroup: rec.radio.scanner
Date: 1996-08-12 00:00:00 UTC
From: cps@access.digex.net
Message-ID: <cps-1208961921110001@newsreader.digex.net>
Source record: 226764

My Pro-2004 seems to be having a problem. It first appeared at static or noise that would appear and disappear, regardless of the signal strength. Now, the reception will sometimes go completely out for extended periods, maybe hours. Then it will come back. My guess was something loose in the antenna input section, but nothing obvious. Tapping on the case doesn't seem to help matters any.

Any suggestions? I'd like to fix it, I'd prefer to not have to buy a cellular-less new scanner.

Chris

Source record: 226767

You didn't say what the frequency was you heard the original transmission. See the text below if it was a low power itinerant freq. It may of help for your search. If it was a regular repeater freq, F-2 is usually the "talk-around" freq. For example, if the repeater output is on 461.100 Mhz, talkaround would be 461.100 simplex, so the radio transmits/receives on 461.100 instead of transmit on 466.100/listen on 461.100.

Here are a few tips on searching for school, fairs, circus,etc frequencies...

There are a number of "itinerant" frequencies for nationwide, low power use. Some use these frequencies simplex, others use a repeater. First, try these:

151.625 154.570 154.585 154.600 464.500 464.5125 464.5375 464.550
469.500 469.5125 469.5375 469.550

The above are by far the most common frequencies. Don't be surprised to hear McDonalds & Burger King order windows on 154.570 and 154.600.

Next, try these:

457.525 457.5375 457.550 457.5625 457.575 457.5875 457.600
467.750 467.7625 467.775 467.7875 467.800 467.8125 467.825 467.
8375 467.850 467.8625 467.875 467.8875 467.900 467.9125 467.925

Low power walkie-talkies may also be licensed in between (12.5 KHz steps) repeater pairs. A repeater operates at 25 Khz intervals starting at 461.
000 for business bands i.e. 461.000 461.025 461.05 ,etc. The walkie talkies can operates on 461.0375 (461.025 +.0125), 461.0625 etc up to 469.
9875. The repeater inputs are 5 Mhz higher, for example, 466.025 is the input to 461.025 etc.

Airlines primarily use the 460.650 to 460.875 and 465.650 to 465.875 range. In areas not close to a mjor airport, these frequencies may be assigned to businesses, police, fire, and other users on a shared basis. Don't forget to check out these frequencies and their 12.5 Khz splinters as well.

Fire departments are asigned the 460.525 to 460.625 band and 465.525 to 465.625. Police departments share the 465.5125 to 465.5625 frequencies with fire. Local government operations, which can be police, fire, ambulance, highway, housing authority, parking authority, can operate from 453.0125 to 453.9875 Mhz and from 458.0125 to 458.9875 Mhz. Some low power survailance and vehicle repeaters operate in this region as well as from 460.0125 to 460.5625 and 465.0125 to 465.5625.

There are a number of local frequencies, that is for local uses such as hospital security, mall security, school security, amusement parks, etc. They are: 464.325 464.375 464.425 464.475 464.525 464.575 464.
675 464.775 464.825 464.875 464.925 464.975. Input frequencies are 5 Mhz higher.

So, try searching 461.000 to 470.000 and see if you pick them up. I think it possible, but unlikely, that school, etc security is using a trunked system.
If they use low band (unlikely) try 35.02 35.04 33.40 33.14. Some schools use frequencies in the 151.655 to 151.985 range.

Some schools (Ossining, NY HS used to) use CB walkie talkies.

On these itinerant frequencies, you will hear store security, highway flagmen, construction workers, some PD's use them for survailances, a whole bunch of good stuff. Hope you find what you're looking for. In the back pages of POLICE CALL (available at Radio Shack) they list usages for all frequencies on your scanner. It goes into alot more detail than I can provide here. As a last resort, ask to see their FCC license. They MUST, by federal law, have one. It will show the frequencies in use.

Business users may be found on 151.955 and 154.515. Some of these may be low power, others are high power. Special Industrial users such as large construction companies may be found on 151.505 158.40 451.800 456.800.

GMRS users are found on 462.5500 462.5625 462.5750 462.5875 462.6000 462.6125 462.6250 462.6375 462.6500 462.6625 462.6750 462.6875 462.
7000
462.7125 462.7250. Input frequencies are 5 Mhz higher. Check out the corresponding 12.5 Khz channels at +5 Mhz of the above frequencies.

Some business/itenerant frequencies are identified by a colorled dot or star. The color codes for these radios is listed below:
BLUE DOT 154.570 RED DOT 151.625 GREEN DOT 154.600
PURPLE DOT 151.955 WHITE DOT 462.575 BLACK DOT 462.625
ORANGE DOT 462.675 BROWN DOT 464.500 YELLOW DOT 464.550
J- DOT 467.7625 K- DOT 467.8125 SILVER DOT 467.8500
GOLD STAR 467.8750 RED STAR 467.9000 BLUE STAR 467.9250

Sorry about the trouble my son Johnnie has caused you folks
on here. You see it all started when the doctors cut off his
oxygen during birth. Since then little Johnnie hasn't been
quite right. He had a troubled life as a child. Molesting
the neighbors dog. Exposing himself to the kids at the playfield.
Self mutation and the like have been a way of life for Johnnie.
You have to understand the terrible things he did weren't
all his fault. Hell, his mom was working the streets at
night just to pay for his depends when he was in high school.
Depends aren't cheap and we didn't want Johnnie to be
embarassed at school. We had to leave the Midwest so the
charges would be dropped from Johnnie. You can't believe the mess
he made on those farmers sheep. Please forgive my little
pervert, he is all that his mother and I have.

Actually, the highest UHF airborne phone channel is 454.975/459.975.

> oh 123.850 is usually helicopter traffic but some people just use it
> as an air to air.
123.850 would be an airport tower. 122.850 is a Multicom frequency.

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Aeronautical Frequencies [87.173]

108.000 - 117.950 NavAids - VOR & localizer, 50 kHz step
118.000 - 121.400 ATC - towers & ARTCC
121.600 - 121.925 ATC - airport ground control
122.000 - 122.650 Flight Service Stations, 50 kHz step
122.700 - 123.500 * (see below)
123.600 - 128.800 ATC - towers & ARTCC
128.825 - 132.000 Enroute - airline company freqs
132.025 - 135.975 ATC - towers & ARTCC
136.000 - 136.475 Enroute - international
136.500 - 136.975 Enroute - domestic & international

25 kHz default spacing, AM for voice

UNICOM - Aeronautical advisory station at airport [87.217]
122.700 122.725
122.800 123.000
122.950 at airport w/ full-time tower
122.975 above 10,000'
123.050 123.075 at heliports

Multicom - common freq. at uncontrolled facilities [87.241]
122.850
122.900 primary CTAF
122.925 Fed/State natural resources

FSS - FAA Flight Service Stations [87.187]
122.000 122.050 EFAS "Flight Watch"
122.100 receive only (w/VOR)
122.200 standard FSS

Burke,
In the public safety world of UHF (450-512 MHz), channel two (or any other channel number) may indicate a car-to-car mode where both vehicles/mobiles operate simplex on the repeater output frequency or another non-repeater frequency. This assumes channel 1 is a half-duplex dispatch frequency. If you hear the reference to go to channel 2, and you do not hear a dispatch office, then assume you are on the repeater input frequency and subtract 5 MHz and begin searching in that region. For example, you hear the request for ch.2 on 465.125 MHz, subtract 5 MHz (460.125) and enter a search range of 460.0 to 460.3. You should hit pay dirt. Most land mobile radio systems are programmed to stay within their band, in fact, the antennas are cut to a particular 5 MHz section of the band. Happy hunting.

Steve S.

Usually the "Channel 2" would be in the same band, and perhaps is the same freq! Most repeater operations allow mobiles and portables to talk car to car simplex on the repeater output frequency, bypassing the repeater. This is often referred to as "Talk-Around" or whatever the next higher channel number than the repeater channel.

Other possibilities include the old channel used before the move to the current channel, a P/W or other local government channel, a specificly licensed car to car channel, or even CB.

Tom Osenkowsky <GSDZ67D@prodigy.com> wrote:
>Fire departments are asigned the 460.525 to 460.625 band and 465.525 to
>465.625. Police departments share the 465.5125 to 465.5625 frequencies
>with fire. Local government operations, which can be police, fire,

Tom, keep in mind that the original poster was here in Canada and almost no rules as to allocation apply here as they do in the states. For example--in my area, all the fire departments that use UHF are between 413.1375 and 413.9875. Police in UHF is on 462.0 to 463.2625. VHF fire is 150-158 and also one department on 169. Rural/federal police is 155.55 - 155.89. Now you go to Toronto (original poster's location) and everything does a 180 degree turn. Police is on 455, fire is in the 800 band for some and the 153s for others, and EMS is in 452s. The GMRS radio frequencies you can use in the States as you would use a CB (if I understand the allocation correctly) is actually smack in the middle of the local police band here!

>So, try searching 461.000 to 470.000 and see if you pick them up. I think
>it possible, but unlikely, that school, etc security is using a trunked
>system.

I was working security last year and we were part of a trunk that was shared by about 25 agencies, including about 15-17 divisions of city services (including Ambulance but not other services) and a television station, a towing company, two security services, and a plumber.

>If they use low band (unlikely) try 35.02 35.04 33.40 33.14. Some
>schools use frequencies in the 151.655 to 151.985 range.

The only thing on low band around here any more is McDonald's (32.480).

>back pages of POLICE CALL (available at Radio Shack) they list usages for

Police Call isn't available in Canada. Instead, we have independently published books by province/region.. but they are indeed available at Radio Shack.

>provide here. As a last resort, ask to see their FCC license. They MUST,
>by federal law, have one. It will show the frequencies in use.

Likely Canadian operators will have a Department of Communications document, not an FCC one.

>Some business/itenerant frequencies are identified by a colorled dot or
>star. The color codes for these radios is listed below:

Finally, I do not believe the dot/star combination is used -at all- in Canada.

Later!

Generally speaking most folks mentioning POTENTIAL EMI problems are correct. Any non-fitted electronic equipment, and so many have some kind of oscillator in them, should not be used 1. without permission, 2. during landing or take off phases. Think about the ramifications. It's taken long enough to get permission to operate anything on a flight. I still have a copy around of the Model 100 Computer Magazine when they were working on this issue. Don't take chances. You may get away with it, over and over, like running your gas tank down or leaving for work late, yet what's the point and what are the potential consequences. Happy listening, JD Former Flight Service Specialist

Sounds like a nifty piece of legislation we have up here now called
EMCAB-2. Part of the reality of it is the necessary tests involve taking
measurments every metre in a cubed grid about the station! Wonder how
much that one is going to cost. It's been stressed at a few meetings that
it's not likely to get to that stage and might only be applied in the
event of an otherwise unresolvable EMI problem, not exactly with you have
to put up with. 73 John VE6OTC

Hi all.

I will be travelling to Hong Kong in the near future and was wondering if anyone had some sort of frequency listing for the Hong Kong area? (Does such a beast exist?)

Also, from what I understand, scanners are not all that welcome in HK so I'm debating on wether or not to bring the Pro-60. Hmmm....

Thanks,

Jesse

Hi Steve and David,

I would seriously suggest that you *not* broadcast inside the AM or FM commercial broadcast bands. I do not think the people of your community would be too thrilled to know that their private moments of crisis are being broadcast for literally *anyone* to hear. Personally, I would be *furious* to discover this (especially when their taxes just paid big bucks for a f#@%!#g "secure?" trunked system).

It takes a little more effort, brains(???), and expense to listen with a scanner than with just an FM radio.

Talk to your radio tech, there should be some legal open frequencies available somewhere. Is your old channel still available? Then they could use their old pagers/Plectrons.

I did not say any of this, but.... ;^)

Perhaps a low-power narrow-band signal (+/- 5KHz deviation) inside an unused VHF or UHF TV channel could be used (Ch. 6 is just below the FM band). The +/- 5kHz is barely detectable with a standard TV and most likely would not even be noticed. But a scanner would be quite happy with it.

But I did not say that, because transmitting without a license is considered very "naughty" and a big "no-no". ;^)

Just a thought!

Bryan:

As I understand it, 100-MW is the max, unless it's C.B., without a
license. That would only give you about 1/4 mile. You might want to
check the law pertaining to rebroadcasting also...may be a problem!

I know that this question has come up in the past but...

How does one go about creating a new group?

I would like to see one for the freq lists that everybody seems to have and seems to want.
You post your requests and if somebody has it they upload the list or e-mails it directly to the requestor.

rec radio.scanner.freqs would be a viable name I would think

Any comments?

Roger

There already are those lists. http://www.oak/oakland.edu

and many more.....they get mentioned here on and off

Or invest a few hundred and create your own html pages
and do it yourself and charge a subscription fee for users

Using an antenna designed for the frequency of interest will provide some
rejection of unwanted frequencies. You must be in a unique situation because
I have heard of Scout owners who get lockups in the FM broadcast band.
I am looking forward to owning a Scout soon to go with my AR8000.

>Appreciate whatever insight you can shed on this.

Speed Loader 23 or SL-23 was made by a guy in Dayton, OH who later moved
to Florida. The SL-23 would let up download from the 2006, edit and then
upload to memory. Worked from the parallel port on your computer. The best
part was the price, when I sam it at the Dayton hamfest it was $59.95 and I
picked up a flyer thinking I would order one. Procrastination set in and I
didn't so he has quit producing the SL-23 and is supposed to be working on
a new version that runs from a serial port.

The name of the company is The Right Connection, owned by Donald W. Laux
and his phone is 904-951-0422, fax is 0424.

I faxed him requesting info and if he had any parallel units left that I
erally wanted one. He said he wanted to talk with me on the phone but I
never could catch him, always got his answering machine with some sexy voice
answering.

If you have any luck please let me know. I don't want any of the other interfaces
as I just need to manage the 400 memories.

Good Luck

>all of the 900 Mhz and above.

Try an antenna cut for 156 mhz and see if you get enough rejection to
eliminate the interference. You may create a different problem as the FM
broadcast band might be strong enough to do the same thing, just on lower
frequencies. Get a BNC connector and put some coax in it, strip the shield
off, leaving the inner conductor only. Start with about 18" and run the Scout
to see where you have problems, keep shortening the coax until you get
satisfactory performance. If this works you can get a BNC to RCA adapter
at Radio Shack and some RCA (phono plugs, audio patch cord type) plugs and
using semi-stiff wire make a series of plug in antennas. I have heard this
works but it is second hand info, don't have a Scout yet so I can't confirm
it. The ideal situation is to have a series of band pass, reject filters to
tailor the SCout for specific bands. Too bad Opto didn't include the ability
to program the Scout for different parts of the spectrum.

Good Luck

Remember who your dealing with-Motorola, the same people who say 800MHz systems are "scanner proof" and will "never" fail. Secure Clear isn't. It's a cheezy 46/49 MHz phone with voice inversion. For about the same price you can get the Escort Courier and its got Digital Spread Spectrum (DS) and it's encrypted. If you can crack it, call NSA and apply for a job. Tropez also has phones that are Digital Spread SPectrum (Freq Hop) and I've seen them as low as $99.

Thanks for the info! I have a PRO2042 with the OS536. The biggest weakness with that sort of setup and ones similar is that there is no inexpensive or simple way to auto program the scanner channels. I don't want to spend $200-$300 for the CE232 interface (actually, I don't want to build and install it in some kind of black box). The SL seems like it would be the ideal thing, assuming that it could be adapted to the PRO2035/2042.

Hi Steve, I wondered if that is also one of the purposes. I thought
that if this is that case then we would generally see different size
balls on different antennas. Second, why is their non on any base or
portable antennas?

Hi Steve, thanks for the information. I thought this would sound
like a really stupid topic to most but I was serious about it.

It would be nice if I could find some literature to support this
reasoning for the Ball on the antenna. It could help to back up what
I said. I can only explain what I know and my understanding or
reasoning. You have helped though. Thanks, its also something else
to think about!

From: ab313@torfree.net
Message-ID: <Dw1414.7y5.0.sheppard@torfree.net>
Source record: 226813

While listening to someone on a UHF frequency (hand-held radio on simplex) I heard them say: "Switch your radio to channel 2".

Am I correct to assume that this frequency will be in the same UHF band as the first one? My first inclanation is to hunt around close by the first frequency, but so far no luck. This second channel is most likely used far less than the first, however. Does anyone think there is much chance that I'm way off, the elusive frequency could be 10 - 15 mhz away, or even in another band altogether? I don't know of any organization that has frequencies in both vhf and uhf in the same HT, except for hams.

Sounds like some moronic attempt to make the US Navy look foolish
(afterall, what kind of idiot captain would navigate into a lighthouse).
It fails, however, as whoever made this up obviously does not know that
the USS Missouri is a *Battleship*. Not an aircraft carrier...

If I were to purchase a mobile scanner today, for use with local
emergency agencies and the aircraft bands which one would be a good
deal. I would like to have one I can mount in the vehicle and wire power
off the battery. Also, hopefully, one that will over come the intermod
of local paging and such.

>trying to get me to buy a more expensive unit?
>Thanks!
>Eric

When deciding which one to buy, I placed the 51 and 60 side-by-side
to test them. The 51 had much better sensitivity than the 60 and the
faster scan rate was also a plus. I live in a somewhat rural area,
so don't have quite as many intermod problems as might be
required by a triple conversion unit in a large city.

I selected the 51 and have been very happy with it.

If you are going to the track, there will be several trailers that will have freq. lists available for sale for around $5.00. It's not a bad idea to pick one up as they will be up to date and the people can make you aware of any last minute changes.(as many drivers have more than one freq.)
Check out Frequency Fan Club at the blue & yellow LOWES trailer. They have lists and also sell great headphones. (This is not an ad, it's just that I bought their headphones and am very happy with how they work)
Also check rec.autos.sport.nascar in usenet for more about nascar.

Subject: AR8000 FILTER MOD DETAILS
Date: Tue, 06 Aug 96 19:19:13 GMT
From: wm8p@infinet.com (Bob Mills)
Organization: InfiNet
Newsgroups: rec.radio.scanner

Hello AR8000 owners,

To my knowledge no one has actually posted a filter mod, here is what
I did. This is my approach and I only know it works well on my AR8000.
Your results may vary. Others may have a different solution that
works better or worse.

THE GOOD NEW:
Is it worth the effort. In my opinion YES!
The search mode is vastly improved on the SW bands. Search stops
on the primary frequency and not 1 or 2 times before and after.
Readability of SW stations is vastly improved. In some receiving
instances it reduces adjacent channel interference noticeably.
On AM receive for aviation frequencies a pronounced improvement in
audio quality is noted. You will be able to select WIDE or NARROW
for AM, NFM, USB, LSB.

THE BAD NEWS:
This is a difficult mod to perform. I have been a ham for over 30
years and have extensive homebrew experience. It took all my skill
and a magnifying glass to perform this mod without damaging the
radio. IF YOU ARE NOT QUALIFIED DO NOT ATTEMPT THIS MOD!
Find a qualified helper.

There is no way to adequately describe the locations on the circuit board to be cut and soldered too. You will have to buy or borrow a service manual.

Study the electrical mods described below and then using an ohm meter and the service manual find the locations to modify on the circuit board.

WHAT IS MODIFIED ELECTRICALLY:
The 4khz filter (F4) circuit is paralleled by a a jumper that is used to bypass the filter for WIDE reception. This selection process is accomplished by switching diodes on each end of the filter and bypass.

Find U2 pin 11 (AM, FM filter bypass) line. Trace this line to a 22K resistor that connects to the switching diodes (near the F4 filter). The voltage from pin 11 is used to bias these diodes into conduction. Cut through the circuit trace at a convenient location just before the 22K resistor.

Find U2 pin 4 (SSB, CW filter inline) line. Trace this line to TWO 22K resistors that connect to the switching diodes (near the F4 filter). The voltage from pin 4 is used to bias these diodes into conduction. Cut through the circuit trace at a convenient location just before the TWO 22K resistor junction.

Unfortunately there is no way for me to put a schematic in for this next part but if you draw it out on paper you should be ok. You are going to mount a small switch on the radio. This must be a DPST switch.

Connect a wire from the WIDE side of the switch to the single 22K point.

Connect a wire from the NARROW side of the switch to the dual 22K resistors point.

Connect TWO 1N914 style switching diodes together to the switch common. Connect them with the black band facing the switch.
Connect U2 pin 11 to the open end of one diode and U2 pin 4 to the open end of the other.

What you have done is to install a switch to reverse the normal filter selection of F4. The 1N914 diodes serve to prevent turning on the BFO in the AM mode and to prevent grounding when in the WIDE SSB mode.

If you have questions you may email me but if you post a reply all may benefit. I make no guarantees, your results could vary. You might not have much fun performing this mod but you will enjoy the results.

>well as any other column seperator.

You are right, of course, in that a word processor can do a lot of
what a powerful text editor can do. In fact, I do use MS WORD upon
occasion when I need to do something that TSE (The Semware Editor)
can't do. But that is rare. TSE, QEDIT, and other powerful editors
are more suited for this task under arduous circumstances.

>In an example as this, I would replace the "....." with tabs in decending
>values, so I would replace first a whole bunch of "..............." and
>subtract a "." each time until I get down to 2. Since the decimal point
>is used in this example, I would have to viualize the results after that
>and replace any stray single decimal points manually.

Nothing wrong with that other than I think it would take a lot longer
than the series of steps I picked at random, more or less. But it
will work, and besides, every frequency post you get will differ as
night and day from all the ones before and those after. So it pays to
learn a variety of techniques.

>Once I get this into a Tab seperated format, I can look at the data to
>check the fields for errors in format or seperation. I then would import
>this into (in my case) Filemaker. Filemaker, BTW, has a neat ability to
>create a standardized layout when a text, .dbf, or other file is dropped
>on it, and will automaticly create a file when this is done.

You're right about a tab format being sensible and easy on the eyes.
And, tab-delimited formats will import into a database manager about
as easily as comma-delimted. But there is a problem with tabs.

One....is that there is no set definition for a tab that is recognized
as "universal". Some editors and word processorss standardize on a
number of characters per tab while others go by a linear distance.

Secondly, is that unless you go to a lot of time and trouble, there
can be a varying number of tabs per line that will result in errors in
how fields are imported into a database manager. Here is an example:

A B C D E
aaaaaaaa bbb cccccc ddddd ee

See how the columns don't line up? To make them line up, you have to
go back to line 1 and insert an extra tab between the A and B columns
like this:

A B C D E
aaaaaaaa bbb cccccc ddddd ee

But on line 1, there are two tabs between A and B whereas on Line 2,
there is just one. If you imported the second "file" into a database
manager, here's what you would get:

A B C D E
aaaaaaaa bbb cccccc ddddd ee

If you got rid of that extraneous tab, then well and good, but then
your data would not line up. So......comma-delimited formats are the
best where accuracy of field placement is important.

>If you try to read comma files in a word processor, you end up with:
>
>"Control 1,Countywide Emergency,(Red),460.025,103.5"

True. BUT....from that file, if you need a more orderly appearance,
you can make a copy of it and replace commas with tabs and havbe your
cake and eat it, too.

>If you used tabs instead you would end up with:
>
>"Control 1 Countywide Emergency (Red) 460.025 103.5"
>
>Since most good word processors allow you to adjust the tab points, you
>can align your columns to allow all your data to line up well.

That's true, but see above. Having the data all lined up is
important, but if there are extra tabs on some lines and not others,
then there will be a problem with extraneous fields created when that
file is imported into a database manager.

>The above procedures have served me well in my books and newsletters, but
>ither options are out there. I prefer this way, Bill likes comma text,
>and you might like something totally different...

Actually........BOTH are good. Visibility and display are enhanced
with tabs. Commas ensure the proper field assignments.

>If there was a "Standard" Rec.Radio.Scanner format I would vote for Tab
>Text since it appears to be the most universally usable format.

For display, sure. No question. But try to import a tab delimited
file into a database manager where the field width varies from one
record to the next, with some short field entries and some long.
You'll spend an inordinate amount of time correcting errors and
formatting glitches.

To that end, commaa-delimited ASCII is less error prone and equal or more widely aceptable for importing by a database manager. For those who publish information or even just post a lot of it, they will find tabs to be the superior, no question about it.

Rgds,

The real ironic thing is that YOU could probably teach me enough to launch a whole NEW series of books and not ever get done in this lifetime.

There sure seems to be a lot of phony emphasis laid on how much one knows. So I want to lay down this one particular cornerstone about myself right now, since the opportunity so aptly affords:

My chief claim to expertise lies not in how much I know about anything, which happens to be relatively nothing; rather it's my ability to *find out* what I need to know in order to accomplish a specific objective to a specific specification.

I can't tell you how many times in my life I've replied to someone, usually a boss or one of my kids, "I don't know, but I will find out."

But it's been a LOT! :-)

Brian Varine (varineb@ucs.orst.edu) wrote:

: Is it me or do trunked systems seem ripe for some sort of attack? Since
: they all have one control channel, seems all you'd have to do is take a
: decent 1000 Watt Xmitter and apply a bunch of noise or micro bursts to
: the control channels data stream and *poof*, trunked radio failure.

That's too complicated for many terrorists, also not 100% effective.
Easiest way: find the microwave tower located at the main controller site
(in many cities, this is located at the communications center[s], separate
from all the transmitters. Blow up said microwave tower. Not only are the
data controllers out of the picture for an indefinite period, but the comm
center gets no radio signals in or out, leaving the units on the street
high and dry.

Kind of scary when you think about it. Reliance on high-tech
communications systems definitely has it's drawbacks.

>Kevin Nelson

I haven't had a look at that http site, (AND it would be grossly
unfair of me to make comments about this one until I have done so),
but as a designer and producer of an AR8000/27000 kitset interface, I
am always sceptical at claims of cheapo (10 dollar/ 5 pound)
interfaces.

Many that I have seen, are "costed" on the MAX232 device and DO NOT
make costing allowances for a COMPLETE and finished unit. (But that's
ok IF you don't mind having exposed electronics susceptible to
interference pick up and short circuit!)

Many don't allow costings for the Special Flat ribbon cable [FFC]
(There are mods to convert the radio to use a stereo jack connector,
but this mod is NOT for the feint hearted!)

Things to be costed are:

PCB or circuit strip board
MAX232 IC or similar
Resistors
Capacitors
Solder pins
Wire links
PCB mounting pillars
Metal case to house the unit
Grommets
Cable ties
A proper screened cable to connect the Interface to the computer
A 9 pin or 25 pin "D" connector to fit the computer
A FFC cable (the flat ribbon cable that fits into the radio)
A means of connecting the FFC to the interface (another socket?)
Heat shrink tubing, wire links .

This lot costs a wee bit more than 10 dollars!

Also add to the above the time involved in sourcing the various
components and materials. (I know many hams and electronics hobbyists

will have junk boxes to source from, but the majority of the scanner fraternity do not have this resource available to them.)

There are various solutions to obtaining an interface. AOR make an excellent unit. It also has the facilities of being able to "Field Clone" one AR8000 to another.

There are other commercially made units that will "interface" to several brands of radios - They cost even more! BUT they are excellent units.

Alternatively:- (and here comes the commercial!)

I can supply a FULL kitset of parts which includes every thing needed including the FFC already sub-assembled onto 1 metre (about 3 feet) of high grade double screened computer cable. There is also another metre of same cable from the interface to the computer. The housing box is a solid die cast unit. I also include 5 detail drawings and a 9 page, step by step instruction sheet. (This is a project suitable for a beginner with no electronics knowledge.)

The interface will do everything the official AOR unit will do with the exception of "Field Cloning" one 8K to another! It is compatible with all the same software that will run on the AOR unit.

Costs:-

KIT for self building: US Dollars 50 or UK pounds 30.
BUILT & tested: US Dollars 75 or UK pounds 45

(The prices INCLUDE delivery by air to USA/Canada)
(Europe by normal land/sea mail)

If Interested, email and I will give ordering details.

Regards

Donald

1 Mile per watt? Is that statute or nautical miles? That's one I haven't heard yet. I guess that's why my 100 watt UHF transmitter goes 100 miles point-to-point ;o)

In all fairness, you were right to point the fellow to GMRS or maybe the new FRS for his noise-free short-range comm needs.

Steve S.

P.S. Bill, you can expect a little ribbing for that range formula.

> although I rarely do.
>

Mick, what actual antenna do you have. The discone is not 9 feet
across, but one of the other two antennas in the catalog might be. Is
it the "All band ground plane antenna" (20-014) or the "VHF-Hi/UHF
scanner antenna" (20-176)?
As far as I know, there is no way to "tweak" the antennas. They are not
directional, so as long as they are mounted vertically, they should work
to the best of their ability. As far as mounting them on the same pole
as a TV antenna, just make sure that they are spaced apart as far as
possible. Most important, use good cable, usually 50 ohm for that type
of antenna, RG-8 type or equivalent. Do not use RG-58 as it has too
much loss at the higher frequencies.

Hope this helps!

>All you do is indicate the state you're in. It was VERY small, like
>a big radar detector and I like that.
>
>Any suggestions?

BAD IDEA!

If it's non-programmable, how will this help you?
If you are in a certain city, you want that city only...right!

So you have to listen to all the rest of what they have in there
and by the time you get back to where you were at, it's passed you
by...you never found out...so you turn on your a.m. radio and turn
to your local news freq show and wallah, wallah, bing, bang, there
it is: what you missed hearing about.

having a non-programmed unit you lose "specificity".....

Why not get a good 100 channel portable with an ac adaptor
and you can listen to it in car or while doing a tinkle.

good ones for around 139 or so from Grove or Scanner World
or look for good used ones on the thread-ads

Depends how many agencies you want to listen to....but 100
is plenty is you don't need 800 system....or 900 in's.

The portable offers more versatility...you can buy a spare
ac adaptor and then just plug in when in car or doing a
tinkle....use of imagination good here. YOu can even
listen to it while visiting inlaws using an ear plug....

=>> > Bill has done quite a bit for this hobby. I have learned alot from Bill Cheek

=>> You must not have known much to begin with.

Lovely comment. You must have been born knowing it all. As an engineer with 30 years of designs, patents, degrees, honors, and more, I assure you I don't know it all, and I'd bet Bill Cheek could teach me a thing or two. So could you, were you so inclined. I wish getting a reality check were as easy as getting a pregnancy check. We'd all expect less ane learn more.

=>> or never learned about common courtesy. Remember how he has called scanner
=>> listeners "dumbass hobbyists"? Have you seen the harassment he gives

Well, from what some of his detractors do around here, he makes a good point. Remember, respect is earned, and if he hasn't earned it, fine, so be it. However, by allowing yourself to display equally poor conduct, no matter how tired you may be of what you disapprove, you simply prove yourself to be his equal.

Whatever Bill Cheek may be, a decent man or a man of little virtue, if you do as he does, speak as he speaks, you announce to the group that you are his equal or less, you cannot be his superior as long as you do what you say he does.

=>;-) If the point is to share information and become more knowledgeable, then
=>again I'd have to advise not to take certain sentences personally. Take in
=>all information, filter out the crap, and get on with your hobby. Sort of
=>like watching the NEWS.

Some peoples hobby, and this holds true for many news groups, is to lower themselves to the standards and level of those whom they hate. It's not something I understand, but it's why my public postings are very few, and my Email to those needing help is kept private. I don't need some flamer hitting me with both barrels because I spell reciever wrong! ;-)

=>Have a great evening!

=>Dave

As I shall, and may you too.

Tony.

(Please don't flame until Thursday. My asbestos suit is at the cleaners)

:>>
:>
:>
:>I hear this all the time; car vs deer, truck vs building, etc...
:>I presumed it was a standard way of conveying what happened, but it does
:>sound funny.
:It is used a lot here, but when we say it it confuses our dispatchers.
:(Then again, when we say "Dispatch" it confuses our dispatchers.) How
:>about car vs. dog, patient trapped? No, it wasn't the dog.. don't ask me
:how, 'cause I didn't see the scene, but the driver of the car was pinned..

Sometimes they drop the "versus" - I've heard "auto-auto", "auto-truck",
"auto-fixed object", "auto-ambulance" (ouch), etc. Occasionally I've heard
"auto-auto-truck-fixed-object". Once I heard a description of a freeway
accident where a pickup sideswiped a large flatbed truck that was hauling
several pallets of bricks plus a forklift, and the truck dumped the load.
It was a slow day, so the dispatcher added a few extra words with "pickup-
forklift-bobtail-portable-brick-wall".

As far as good stories, anybody from San Diego want to contribute the
"Quick-Say-Sandwitch" story?

SUGGESTION FOR THE AGENDA OF THIS GROUP VIS A VIS
THE BILL CHEEK SAGA...by.....

Why not do as the Dave-Guy does: Have a Top Ten Contest and
publish them.

WHY DOES EVERYONE HATE CHEEKS....

1.
2.
3.
4.
5.
6.
7.
8.
9.
10.

The REC.SCANNER's Top Ten Selections are above.
Printed on your printer so you can keep this for a keepsake
and show to your family or friends and have your laugh.

This way we all have a laugh and then we do as the Dave GUY
does and go on to the next TOP TEN for another topic on
another day.

Post it to alt.angst and then just know that you have your
copy at hand to review as you disagree with the Cheeck's GUY
and allow the rest of the group to go on to Scanner Things.

How many of you are willing to act this GROWN UP. QuestionMark

You can even print up hundreds of copies and send them to any
one who inquires...charge $1.95 postage paid. Over-night will
be extra.

What u say brah?

+ cONFUSING....ain't it?
how do they catch you? do they have a "call the police if?"
you see one in someone's car hotline?

How can it be illegal to listen to public access talk....
move to another state....it's called "totalitarianism"

that is why the portables are so greast....you can put it
inside a dummy radio....or a dummy policeman....or a dummy
coke can....camouflague it.....make it look "politically
correct"....

In CAlifornia it's illegal to NOT WEAR SEAT BELTS in car
while driving ... what a crock. Guess how many don't
wear belts....? It's illegal to spit out of a car onto
a public street...right!

get a portable and "dummy it" to make it look unlike what
it really is.....is it illegal to think in your state?

> Thanks in advance. kdr3@ix.netcom.com

Works for me...worthless in large cities though but about the only thing you got on the open road when no one else is driving it. I'd recommend a CB first though. You'll find it handier than the Valentine. All 3 excel at certain times but if I had my choices of the 3 I'd choose the CB over my Valentine or BCT-7 but I'd rather have all 3! :-)

I'd also recommend getting a mobile antenna from Radio Shack for the scanner. Get a good one and not a cell phone look-a-like. The BCT-7 covers CB Frequencies but the range isn't very good at all.

Just my 2 cents. They've worked for me and I've made some pretty wild ticket free trips. Feel free to drop me a line for more ideas.

Strangely or not so strangely, depending on your perspective, there is
a good chance that IC-502 on the Logic/CPU Board (PC-3) has gone noisy
on you. Replace it and see what happens.

IC-502 is a TD62504P

You might can order it from Tandy National Parts (800) 442-2425
though they have stopped supporting parts for the PRO-2004. Worth a
try, I suppose. If that doesn't pan out, you can order and adapt the
one used in the PRO-2006 as IC-503, a TD62504F. The chips are the
same, except that the 2006 version is a surface mount type where yours
is a DIP style. So you would have to adapt it. Could be done.

I've had this exact problem before, so I am not guessing at it, though
the proof lies in the replacement to be sure.

Rgds,

Bill

I have read the same thing. The ball is for static electricity disipation. As far as sharp points on the car body goes, I'm not sure I understand. The antenna is not a grounding device. The sharp points may disipate electrical energy but they are not connect to your radio by way of the antenna port.

Hope it helps...Don.

That quote, if that's what it is, is really flawed. Bad. Think about it. Think deep. Go sit on the thundermug; elbows on knees; and chin in one hand. And think.

It may come to you just what is wrong with what you quoted. If it doesn't, then you may be flawed. The above is exceptionally nescient, if it comes from a "staff scientist". I have a hard time believing that, but no matter. The flaw is obvious.

Here is a list of COMMERCIAL Air to Ground Telephone freq that I have...
To save space the hi and low freq is posted for each block and the channels are spaced 6 Khz apart. A specific block of channels is assigned to each geographical area. Ground Freqs are 45 Mhz lower and do not echo the airborne half of the conversation (half duplex). These all use the AM bands

I'm not sure where I picked this up at, but I hope it helps.

:The price of the CE-232 Kit has been permanently reduced to
$149.95 + $5 S&H

Is that the price of the kit? I was thinking of the price of a fully assembled unit, in an external box. I thought that was closer to $300. My apologies if I am mistaken.

> (actually, I don't want to build and install it in some kind of
> black box).

:You can install it in the scanner, if you like. Installed :externally,
:however, it can serve a number of other scanners, too.

I already have an OS535 installed, hence the reason for an external device.

This was the Sony Air7, same size and strange urgonomics as the Sony Pro80, but covered 108-136 without the external converter required by the Pro80.

I can not remember the whole spec, but at the time (about 12 years ago) it was pretty hot as a handheld air band receiver.

Unless Sony have released a new version?

Anyone remember the T.V. program called One Adam Twelve?

I was monitoring my local PD tonight and found the dispatcher calling to One Adam Twelve and snickering everytime she called out "One Adam Twelve". I wouldn't think this to be so strange except that they don't normaly have a unit called One Adam Twelve, in fact they don't ever use a number before the unit type! The unit numbers are formated like this ...

Axx

'A' is the unit type (P=Patrol, A=Two person patrol, M=Motor unit, etc...)

The next number 'x' is the shift (1=morning, 2=day, 3=night)

The last number 'x' is the beat (1 through 6)
Now if it was A12 it would be a two person patrol car on morning watch (that all fits) but the last number '2' would be someone in the west part of town (that doesn't fit since they had calls all over town).

Now the 1st number is a total mystery since they don't use a number before the unit description!?!?

The only thing I can figure is that they might have a ride along (maybe someone from a TV program like COPS?).
Since the city I live in is the second safest city in the U.S. I can't imagine any TV program wanting to do a ride along here... hmmm... guess it's time for some social engineering with the local PD :)

Hey Tracy,
I would think that since you mentioned the dispatcher snickering every time she used the call that it was probably an inside joke within the PD. Perhaps a new rookie had mentione dthe TV show and had that "Nickname" pinned on them. You'll probably not hear it often if any more.

Sony AIR-8 in the States (& the AIR-5 is a few other far distant flung
places). Other than the "airband" it covered the AM MW and FM Broadcast
bands together with the VHF Amateur, Marine and PMR bands between
144-174'ish MHz.

If you have a US Flying magazine look out for "Sportys" flying shop. You
might still find they have the AIR-8 available.

The AIR-7 has not been available here in the UK for some time now although
used/secondhand ones appear now and again.

> I can not remember the whole spec, but at the time (about 12 years

In terms of audio quality, sensativuty and selectvity the unit was very
good.

Just 10 memory channels available though for each of the Frequency "bands".

> Unless Sony have released a new version?

Nope.

Well, not if you do it yourself. :-)

I think others have done dual internal installations before. Should
be room unless lots of other mods have been added, too.

But external is the best. Facilitates troubleshooting and ease of
other mods. And it can work with other scanners, too. That's the main
deal there.

>
> b) can I leagally listen/transport a scanner in England?

Yes. No restrictions/legislation on scanners of the frequency coverage they may have here in the UK.

> c) if so, what freqs should I listen to there?

Legally you can only listen to Broadcast Transmissions (AM & FM), CB & Amateur radio transmissions and when at sea Marine weather broadcasts.

Anything else whether it be Aircraft, Fire, Police, Cellular is in breach of the Law although in reality you are unlickly to end up in any form of trouble.

For more info of the UK "official" stand on scanners see:-
http://www.open.gov.uk/radiocom/rahome.htm"

For a good guide to the UK frequency allocations see:-
http://www.waverider.co.uk/~paulj/ although I think Paul has a new site on www.termcon.demon.co.uk/

> The scanner I would be using is a pro 34 (cell unblocked)

The analogue cellular frequencies used here in the UK differ from those in the US. 872-905Mhz for mobile and 917-850MHz for the Base end. Channel spacing is 12.5KHz (Actually 25KHz but starting at .0125MHz).

If ou have any specific frquecy requests try the alt.radio.scanner.uk newsgroup.

Have a good trip.

1264. CORRECTION AR8000 FILTER MOD

Newsgroup: rec.radio.scanner
Date: 1996-08-13 00:00:00 UTC
From: wm8p@infinet.com
Message-ID: <4uq9hq$ion@news1.infinet.com>
Source record: 226671

IN THE FOLLOWING I LIST A DPST SWITCH, ALL THAT IS REQUIRED IS A SPST. WHEN I ORIGINALLY DREW UP THE PLANS I USED A DPST BUT THEN REALIZED A SPST WOULD SUFFICE. HOWEVER WHEN I TYPED THIS UP I HAD DPST BRAIN LOCK. SORRY FOR THE ERROR.

Hello AR8000 owners,

To my knowledge no one has actually posted a filter mod, here is what I did. This is my approach and I only know it works well on my AR8000. Your results may vary. Others may have a different solution that works better or worse.

THE GOOD NEW:
Is it worth the effort. In my opinion YES!
The search mode is vastly improved on the SW bands. Search stops on the primary frequency and not 1 or 2 times before and after. Readability of SW stations is vastly improved. In some receiving instances it reduces adjacent channel interference noticeably. On AM receive for aviation frequencies a pronounced improvement in audio quality is noted. You will be able to select WIDE or NARROW for AM, NFM, USB, LSB.

THE BAD NEWS:
This is a difficult mod to perform. I have been a ham for over 30 years and have extensive homebrew experience. It took all my skill and a magnifying glass to perform this mod without damaging the radio. IF YOU ARE NOT QUALIFIED DO NOT ATTEMPT THIS MOD!
Find a qualified helper.

There is no way to adequately describe the locations on the circuit board to be cut and soldered too. You will have to buy or borrow a service manual.

Study the electrical mods described below and then using an ohm meter and the service manual find the locations to modify on the circuit board.

WHAT IS MODIFIED ELECTRICALLY:
The 4khz filter (F4) circuit is paralleled by a a jumper that is used to bypass the filter for WIDE reception. This selection process is accomplished by switching diodes on each end of the filter and bypass.

Find U2 pin 11 (AM, FM filter bypass) line. Trace this line to a 22K resistor that connects to the switching diodes (near the F4 filter). The voltage from pin 11 is used to bias these diodes into conduction. Cut through the circuit trace at a convenient location just before the 22K resistor.

Find U2 pin 4 (SSB, CW filter inline) line. Trace this line to TWO 22K resistors that connect to the switching diodes (near the F4 filter). The voltage from pin 4 is used to bias these diodes into conduction. Cut through the circuit trace at a convenient location just before the TWO 22K resistor junction.

Unfortunately there is no way for me to put a schematic in for this next part but if you draw it out on paper you should be ok. You are going to mount a small switch on the radio. This must be a DPST switch.

Connect a wire from the WIDE side of the switch to the single 22K point.

Connect a wire from the NARROW side of the switch to the dual 22K resistors point.

Connect TWO 1N914 style switching diodes together to the switch common.
Connect them with the black band facing the switch.
Connect U2 pin 11 to the open end of one diode and U2 pin 4 to the open end of the other.

What you have done is to install a switch to reverse the normal filter selection of F4. The 1N914 diodes serve to prevent turning on the BFO in the AM mode and to prevent grounding when in the WIDE SSB mode.

If you have questions you may email me but if you post a reply all may benefit. I make no guarantees, your results could vary. You might not have much fun performing this mod but you will enjoy the results.

Here ya go.

-= Bill=-

```
=====================================================================
=====================================================================
How to add a hold function to the Radio Shack RF Frequency Counter:
=====================================================================
```

Ground TP 17. In the schematic, TP17 is pin 1 of U3, connected to +5V thru a 47k resistor. On the circuit board, TP17 is on the display side, just right of the lower-right corner of the IC. Grounds are about 1/4 inch below and to the right, the three non-tinned points in the large area of metal. TP17 is the tinned pad next to a SM resistor marked '473' for 47k.

Rig a momentary switch to ground TP17 thru a 1k resistor! Drill a small hole to mount the switch just above the plastic depression so you can push the button with your right thumb. A small toggle switch would fit if you want to hold longer.

>the unit type! The unit numbers are formated like this ...

Possibly a radio visitor from another agency was on channel? How
is your local Sheriff's unit numbering?

>Axx
>
>'A' is the unit type (P=Patrol, A=Two person patrol,
>M=Motor unit, etc...)
>
>The next number 'x' is the shift (1=morning, 2=day, 3=night)
>
>The last number 'x' is the beat (1 through 6)

Up here in Contra Costa County, their is a common numbering scheme
which extends throughout most every department in the county. It is
entirely possible for a 1A12 (One-Adam-12) to exist here, but I have
never heard it... Most I have heard is a 1A1 and 1A2.

The first digit(s) represents the community, with one (1) being the
Sheriff's department itself. The Next field is the Duty, with "A"
being administration, (ie: chief, sherrif, undersheriff, etc). The
last field is the beat or senority level.

The following are some Contra Costa designations:

A - administration (ie: chief)
x - day shift
y - swing shift
z - grave shift
s - sergeant
m - motorcycle/morgue (talk about a generalization) [See adaptation below]
i - investigator/detective

Now in Moraga, "16xX" land, they don't have a motorcycle unit, and being
that the morgue is run by the county, any morgue unit would have the
call "1Mxx". The callsigns "16 mary 1,2,3, etc" have been adopted by
the local college's Public Safety Department. They don't pop up on
the county dispatch system, but the Moraga police do pop up on their

system (154.6) (ehm... as did some armed robbers once). It is probably no coincidence that "Sixteen Mary <xx>" sounds similar to "Saint Mary's", for that is the name of the college...

But then, there are ghost stories about the catacombs there... maybe they did choose it for the morgue reference?

Most trunked radio system users will not be without communications if the central controller failed, was destroyed, or was jammed. (by terrorists, aliens, etc.)

If the control channel is jammed the system can usually set up a new one on another frequency in the system. Most trunked systems move the control channel around periodically anyway.

In the event of a central controller failure, a trunked system will fall back to conventional configuration. The repeaters act like conventional repeaters and the radios take on a conventional personality. Motorola calls this "Fail-Soft". All of the radio are programmed to take on a specific Fail-Soft personality in the event of a central controller/system failure.

With this in mind, a trunked system is no more at risk to a complete communications failure than a conventional two way radio system.

Please accept my humble apology for the TERRIBLE activities of
my son, little Billy Cheek.

You see, this all started when he was a little boy. Billy had a very
difficult childhood. None of the other children liked Billy. He
grew up without friends. So he did many strange things. His mother
once caught him having sex with the sheep, another time I caught him
torturing small animals. As you can see, Billy has had problems.

He has had several homosexual experiences growing up, & got thrown
out of the military when his drill sargent caught him giving a
blow job to a black private. This was the start of Billy's
crush on Black homosexual men.

His mother & I have paid for the best Psychiatrists, Psychologists,
& they even tried brain Surgery once. A strict adherence to the
anti-psychotic & anti-depressant medications he takes (Prozac,
thorazine, and several others) have helped somewhat.

The root of Billy's problem is his issue with self image. He
must feel he is better than everyone else. In order to
do this, he constantly puts others down.

I MUST go now, the tears are bluring my vision of the keyboard.

Word has it that this rig will be reinvented early next year by that eclectic distributor, AOR, as the AR-16 handheld. One additional 100-channel search bank, auto-store, etc. Dunno if there will be a Welz or Standard branded version of the updated model.

The dispatchers for the Virginia State Police are about as professional as one can get in the profession. Their diction is clear and distinct, information is passed quickly and clearly, and there is little traffic beyond what is necessary to get the job done. At times, they border on boring with their clipped, almost stattaco delivery.

However, a few years ago, one of the dispatchers in the Salem, Va. headquarters lost it big time. She was reading off some DMV information in response to a trooper's request for a 10-28. She was so focused on the job that she didn't pay attention to what she was reading.

The dispatch went something like this:

"The vehicle comes back registered to John's Used Cats, 1428 South Main ..."
A pause.
A small giggle.
"Hey, someone entered that as 'Used Cats'. . ."
She realized just what she had said and began laughing hysterically, all while still keying the mic.
"It said 'Used Cats'," she repeated while still laughing, then the transmission stopped.
"The vehicle is registered to John's Used Cars . . ." came back a male voice about 15 seconds later.
In the background of his transmission, you could still hear the other dispatcher laughing, trying to regain her composure.

That was first and last time I have ever heard a Virginia State Police dispatcher let the facade crack just a little bit.

Right - but some jurisdictions are putting everyone and his brother on
the same trunked system. What happens during a major disaster when the
the system drops into failsoft mode and the police, fire dept, dog catcher,
trash collection, flood control, city engineer, coroner and traffic signals
maint. find themselves suddenly forced to share the same pool of conventional
repeaters? While a set of, say 5 repeaters is sufficient to handle N fleets
in standard trunking operation, I have my suspicions that the same set of
repeaters would not be sufficient to handle the needs of the various users
in conventional mode - particularly in a disaster or tactical response.

Communications failure does not necessarily require complete equipment
failure...

> brpeter@ix.netcom.com

Your problem is most likely overloading from nearby FM transmitters. I have the exact same problems with my PRO-2006, but after installing a FM trap filter it works just fine so I'll recommend such a filter as your first try.

The filter I'm using does not cause any attenuation on frequencies above 118 MHz at least. I have not done any comparison below 88 MHz, but I think the attenuation would be minimal.

Regards
Per

Have you considered getting a good handheld scanner for use in the car?

You can get one that can be powered through a cigarette lighter adapter. I have a PRO-60 that I use in the car. I plug it into a extension speaker when I'm using it for extra volume. It runs for weeks on fresh batteries, or can be powered with a cigarette lighter adaptor.

This way you can take it with you when you need to, or can stow it in the trunk if you're in a bad area.

Yes I have had an agenda against Bill. I suggested a truce to Bill, &
his
behavior will show wether or not he chose accept this.

> Try this out - If your best friend made a mistake (harmless, not murder -
> you
> get the idea) would you say "go to hell" or "man, you screwed up, lets go
> get a beer."

I tried to work with Bill at the original time he made all the trouble.
He
responded with telling my Sysop a bunch of lies & half truths

As I said above, I suggested a truce to Bill & I think he is abiding by
it.
He appears to have been taught the lesson, "if you fuck with the BULL,
you're
gonna get the HORN". Hopefully, he will NOT have to be taught this
lesson
a 2nd (or 3rd) time.

Bzzt! This is OLD folklore. Funny thing... last year it was being
passed around a the ship being called the Enterprise, which IS a
carrier... but this yet to be proven true story, has been around longer
than since 1995.

>Last night a police woman asked the dispatcher "What does the fire department
>have going on?"
>
>"A fire" (laughter could be heard from other dispatchers)

This is really a stupid response. There are dozens of things the
fire department could be responding to, and many of them might require
police assistance. If the dispatchers were indeed laughing about
that question, then the lot of them should probably have their
employment with the agency re-evaluated, for that would seem to
indicate that they have more than one dispatcher monitoring the
same channel, but IMHO, the laughter was not associated with the
officer's querry. I hear this type of call all the time, and the
dispatcher might answer "fire", "medical", "child in drain", or even
"It's just coming to us now, 11-87 car VS tree, child trapped in
carseat..."

I recall hearing one a few years ago, where an officer in my town
jumped on a fire call in a neighboring city, got there before the
fire department even, and rescued two kids out of the burning house.
If he hadn't been snoopy enough to have his scanner on the fire
frequency, or to have asked the dispatcher what Fire was responding
to, who knows what might have happened to those kids.

Hopefully what you heard, was an innocent response from the dispatcher,
and the background noise of the typical "slow time at the dispatch center"
socializing.

1296. New AOR Product Mailing List

Newsgroup: rec.radio.scanner
Date: 1996-08-13 00:00:00 UTC
From: rmckenzi@chezrob.rpmdp.com
Message-ID: <4ur245$ica@news2.inet.net>
Source record: 226703
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

Hello folks,

I have created the new AOR list. This list will permit the discussion of ALL AOR products current and future. I would like to see the AOR folks on that list and perhaps use it as a sounding board for new features or for gathering thoughts and ideas. Initially this new list can be used as a support area for other AOR scanners like the 2700, 5000, 3000, etc., etc. If there are not other specific mailing lists out for those other scanners I will create new lists as needed.

I won't stop the discussion of the AR8000 but I will post when it comes up that those looking to discuss at radio should join the ar8000 list.

Again, the new AOR list is up and running.

To subscribe to it simply send an email to:

majordomo@ml.rpmdp.com

In the BODY of the message put these 2 lines:

subscribe aor
end

Or if you want the digest version put THESE 2 lines in the message:

subscribe aor-digest
end

If anyone sends this new list info to anyone (in the newsgroups or by email) please keep it as I have writen it to eliminate any incorrect instructions for getting on the the list. I don't need any more bounce messages a day!! :)

Cheers!!!

Your quest is noble, well-intentioned, and will help many people.
Please don't loose sight of those who may be new to our hobby and/or
new to the internet. I'd like to believe that the bulk of people on
this NG have not inflated their ego to the point that they will be
demeaning to newcomers, as is the case on so many other newsgroups,
where if you're not an elite old-timer, you have no value.
Immortality exists only in those who will follow us.

Am as in what band? Am radio 540Khz to 1700? 108 Mhz to 138? or 225 to
400? It really depends on the band and not so much on whether it's am or
fm.

Several Tri Band Ham antenna on the market work pretty well across much
of the 8k. Nothing is going to work everywhere well. You'll want a long
wire for the shortwave freqs and one for AM radio too. My Yaesu FT-51
ham antenna which is VHF and UHF works well for comercial aero and
pretty well on Mil air too. Look for an antenna at most ham shops and
they'll usually be able to match one up for you.

Les

1302. Re: Famous Questions

Newsgroup: rec.radio.scanner
Date: 1996-08-13 00:00:00 UTC
From: Mike Mayer <mayermh@ix.netcom.com>
Message-ID: <32111AEE.3443@ix.netcom.com>
Source record: 226709

Here are some of the more popular questions, including one already mentioned:

1. What are the cordless phone frequencies?
2. What are the cellular phone frequencies?
3. What is the best scanner for under XYZ dollars?
4. What is the best scanner?
5. What's the difference between frequencies and channels?
6. Why does my friend's scanner pick up XYZ frequency and my scanner is silent?
7. What's the best scanner antenna?
8. Does anyone have the cellular mods for XYZ scanner?
9. What about scanners on airplanes? Why can't I listen?
10. What does XYZ code mean for the Happyville police department?
11. Does anyone have the frequency for XYZ city police/fire/EMS/race cars/airport/FBI/DEA/IRS/NASA/McDonalds?
12. What's the difference between scanner XYZ and scanner ABC? I am thinking of buying one of the two and looking for opinions.
13. What's the best scanner interface software?
15. What's the best scanner interface hardware/cable?
16. How can I modify my scanner to get cellular -OR- Where can I buy a scanner that gets cellular?

In my opinion these are ALL valid common scanner questions, and no less important to someone somewhere than some of the more technically arcane questions you see on this newsgroup. When I started scanning about 4 years ago these very questions were important to me. Remember, the only dumb question is the one that was not asked. Therefore by definition there are not dumb question. Hats off to Malex007 for volunteering to put together a FAQ. Also, Bob Parnass periodically posts some excellent pieces, "Introduction to Scanning" and "How to Buy A Used Scanner" (I may not have the titles exact). Bob's postings cover a lot of ground in regards to frequently asked scanner questions. Somone (sorry I forgot who) also has occasionally posted a nice FAF (Frequently Asked Frequencies) list which covers most of the interesting bands.

Bon Apetit!

Mike

Well, this is the way it is supposed to happen. Fact is that it doesn't. Portland had theirs go haywire and never went to failsoft mode, I can't recall the system EVER going to failsoft and it's failed a bunch of times (See my webpage for newspaper articles). This from the company that proclaimed it could never fail!!! And for a few million more they'll fix the problems.

I am not a techie, but I did find that the collapsible Radio Shack
antenna gives better reception and you can tune it by just pulling out or
pusing in the sections. Of course, it's longer than a duckie.

I asked a similar question awhile and got mixed answers. Some people did
not think that the more expensive duckies were worth it.

Maybe a real techie can give you more information.

I talked to a police officer about it tonight and he said that
One Adam Twelve is a correct call sign. They don't normaly
use the "One" before the unit since the "One" in "Twelve" and
the "One" before Adam both mean morning watch. He said that
the dispatcher was probably just having a little fun with it.

: As I understand it, 100-MW is the max, unless it's C.B., without a
: license. That would only give you about 1/4 mile. You might want to
: check the law pertaining to rebroadcasting also...may be a problem!

No, the 100 milliwatt limit only applies to the AM Broadcast band and the 49 MHz walkie talkie band. In the US regulations, there are something like 18 different categories (paragraphs) for the various license free uses. The FM band is limited to a field strength (instead of the more easily measured input power) and if you convert it to a radiated power, it's something like 30 nanowatts, good for 100 feet or so.

Those curious enough can find the regs in the book "Code of Federal Regulations, Title 47 (Telecommunications), Parts 0 to 19", in Part 15, Subpart C "Intentional Radiators". A good library would have this in the Reference or Government section, or you can buy the book at a US Government Bookstore for about $20.

You can get it a little chunk at at time on the US House of Representatives web pages in their Code of Federal Regulations search engine. Try a search of "Operation in the band 88-108 MHz", for the specific (and short) section on the FM band limits. (I find it such a pain to use that server that a trip to the library is easier.)

John Mackey says;

>Yes I have had an agenda against Bill. I suggested a truce
>to Bill, & his behavior will show wether or not he chose
>accept this.

Huh? You are on rec.radio.scanner for two days then
attack Cheek over something that happened on Fido?
How about an apology from you first? You had no right
to bring your agenda here.

>I tried to work with Bill at the original time he made all
>the trouble.

Typical Mackey. Who started the trouble? Once again John you
skew the facts. It is so easy to see through you. The chain
started with Hugh Duff attacking Cheek. You just jumped
in to cause trouble, period.

>He responded with telling my Sysop a bunch of lies & half
>truths

With the actions you have shown over the past months on the
newsgroups who would ever have to lie about you? Come on
John, if you are so good and pure why do you have to
hide from everyone??? Lies and half truths are your
trademark John, very few on here have ever tried to copy
you.

>As I said above, I suggested a truce to Bill & I think
>he is abiding by it.

Who really cares what you think John. From reading the posts
the last few weeks most think very little of you. Abiding
by it. Gosh, stroke yourself again John. Feel big now? Do
you always play these little fantasy games in YOUR world?

>He appears to have been taught the lesson, "if you fuck
>with the BULL, you're gonna get the HORN". Hopefully, he
>will NOT have to be taught this lesson a 2nd (or 3rd) time.

OOOHHH! John you are such a man! OH wow! You can come up
with cute little cliches that contain the "f" word.

Earth to John, the only lesson that you have taught
is you are a lonely sad guy looking for attention.
You will take any attention no matter what you have to
do to get it. All the years that I have read Fido and

the Internet I have never seen anything posted by
John Mackey that was of a helpful or useful nature.
No information, not tips, nothing at all. All we see
is John in the middle of flames and abusive conversations.
You don't even have the balls to have an e-mail address.
Why? If you weren't hiding behind remailers your
access and some income would be down the crapper. You
already have a little heat there anyway. Your change in
the way you post hasn't gone unseen either.

Karma John, it always gets you. I am glad I won't be
in your shoes when what goes around catches you!

Me

P.S. Yep, when you post your E-mail address I'll
post mine. But your kind aren't man enough to face
people one on one, John. You're the typical hamfest ham.
10-4 ???

Ok, I finnaly got my bc200xlt, played with it for a bit, it was cool, and then I modded it, played with it for a bit, it was still fine and picked up 800 range, next day, the scan pissed me off because a whole bunch of bullshit was programmed into it, so I erased it, then,tried searching, and it wont pick up barely any channels!!!!!!!! This is making me very angry, whenever I try to search 100 or sumthin like that, it says Error, has anyone had this problem, or know how to fix it?? Please help me, also, if anyone knows the correct procedures of adding channels to the scan list tell me.
PLEASE E-MAIL ME!

>
You might find that it is the same frequency as channel 1!! UHF is usually a repeater, where the cars talk to the repeater on 465.325 for instance, and the repeater rebroadcasts their transmissions on 460.325 with more power, allowing all cars to hear each other. If you listen to 460.325 you hear the cars and the dispatcher. If the cars switch to another channel with a transmit AND receive on 460.325 they can bypass the repeater and have a car/car conversation without bothering the cars that are far away. Since the cars are lower powered than the repeater their range is limited...hence you may not be hearing them. And since they are still receiving on the repeater output channel they won't miss any dispatches while on car/car. It is sometimes called "talk-around," too.

This is sometimes confusing when the words channel and frequency are interchanged. A channel is made up of a frequency (or pair of frequencies). In the above instance, the same frequency can actually be the same for 2 channels.

Since that year has passed, that list has popped up at least 50 times, I
probably posted them 40 of those times. Here it is again...

Cordless Telephone

Narrow band FM

Channel Base Handset

1 43.720 48.760

2 43.740 48.840

3 43.820 48.860

4 43.840 48.920

5 43.920 49.020

6 43.960 49.080

7 44.120 49.100

8 44.160 49.160

9 44.180 49.200

10 44.200 49.240

11 44.320 49.280

12 44.360 49.360

13 44.400 49.400

14 44.460 49.460

15 44.480 49.500

16 46.610 49.670

17 46.630 49.845

18 46.670 49.860

19 46.710 49.770

20 46.730 49.875

21 46.770 49.830

22 46.830 49.890

23 46.870 49.930

24 46.930 49.990

This reminds me of a radio intercept I heard for a broadcast station.

There was a sulfur processing plant which caught fire, and the local newstalk station sent one of their reporters up in a helicopter to cover it. (To add to the insult to injury, the reporter they sent up, who happens to have trigger kneejerk reactions, hosts the Sunday GodTalk show on the same station.)

At the point when a secondary explosion at the plant occured, the station wasn't rebroadcasting the reporter's two-way transmission, but those listening to the two-way, were able to hear "The whole God damn place is going up!" I can't recall if there was an "Oh SHIT!" in there or not.

I've not used the Scantenna, but I do have a commercial 2 meter ground plane as well as a Diamond discone. On lower frequencies, 25 to about 220 MHz, it blows the discone away. At 440MHz and up, the discone is infinitely superior. That's not to say that a 440 ground plane would not ouptperform the discone around 440 or higher, it's just that I don't have one to compare it with. Whatever you use, make sure that you use LOW LOSS coax cable, or any gains you get an antenna will probably be lost in the cable.

Hi, saw the post about your PRO-43 antenna and I have some info to share. I tried to E-mail & post a reply yesterday but it looks like something went wrong and it never made it to the newsgroup. Let me know if you got the E-mail.

The 200XLT antenna is a better replacement. I was told the Radio Shack PRO-34 antenna is the same as the 200's. I've used both and they both work better overall. I see someone has already mentioned the PRO-34 antenna.

Don't overlook the Shack's collapsible center-loaded 20-006 antenna. It is an excellent choice. You can "tune" it to the band you wish to monitor and it will cost a lot less than buying a new duck. I'll talk about tuning it after I talk about the duck antennas.

Another choice was the RS 32" collapsible. I don't see it in the catalog but I have one and it works very well, better low band performance.

If you really want a collection of ducks, I would recommend the Centurion line of antennas. a couple of years back they would sell direct to an individual like you and me but they've stopped the practice.

I found a distributor locally but when I asked if they'd like their name posted they declined. Centurion had problems collecting money from individual accounts I was told, and I suspect this is why my distributor doesn't want to advertise to the scannists.

However, you can look for a distributor in your area. You can use the phone book or Alta Vista on your computer. Look under two-way radios, radios, antennas, etc... you'll narrow it down pretty easy.

You might wish to call Centurion and ask them for a catalog and the name of a distributor near to you. The number is 1-800-228-4563.

I'll list the Centurion antennas I use. If you have any questions, E-mail me and I can get into more detail, I have their latest catalog.

The best low band antenna is their EXL model. It covers 30-50MHz and is available in bands of 30-36, 36-42, 42-50MHz. It is a bit long at 11".

The best dual band they offer for VHF/UHF is the EXY model. It covers the 140-174 and 400-512 bands. It's about 6" length but can be reduced to 5 1/4" by trimming the PVC jacket.

They offer numerous VHF style antennas. I've had a couple "cut" to specifc freq's and they seem to perform well. I believe it's the EXS line that you'd want, about 3 1/2" long and they offer a fully jacketed antenna,

i.e., they metal BNC connector is also covered by the rubber jacket. It looks neater and fits snugly on your scanner.

A UHF model I like is Style G model. It's a 1/2 wave and offers 2.5db gain over a standard 1/4 wave antenna. It's base loaded and is about 13" long. If that's too long they also offer a 1/4 wave model called the EXC. I have one cut to a local very low power simplex freq and it really pulls in the signal better than any of my other antennas. About 6" long.

The best antenna overall for my PRO-43 is the EXG which covers the 806-960MHz band. It offers 3.0db gain in a 5/8 wave design, base loaded. Anyone who owns a 200XLT knows it's a brick when it comes to monitoring the 800 trunk band and anything in the 806-960 band. This antenna makes the 200 hear, that's pretty damn good. It measures 8", I keep a spare in my glove box. It's a dynamite antenna.

One advantage to the EXG is that it attenuates the VHF band somewhat. But I find that that's perfect on my PRO-43 which is intermod prone in the VHF band where it's much more sensitive than the 200XLT. This allows me to use it when I'm in a high RF area, especially near pager sites, which are everywhere.

If you want a duck and want only one, the EXG is it. If you want several I'd order a Centurion. They cost $18-24 each. You can also find ducks at flea markets. You'll have better success in ordering a duck cut to the particular freq you want though.

Again, let me know if the previous post got through and if you want, E-mail me about the Centurion line and I'll answer your questions as best as I can.

BTW, an antenna cut to a particular band works very well on a frequency counter by helping it become more sensitive to the band you want to capture a signal from. My Interceptor also likes tuned antennas which help make it less sensitive to TV and radio station RF.

20-006 tuning:

Tuning the 20-006 is simply a matter of experimenting with the antenna by collapsing various sections. Here's one way I found to make it work better on low band and VHF high.

The antenna consists of 5 sections on top of a center loading coil and then 4 more sections under the coil. Section 1 is the top element and #9 is the bottom one for this discourse

Try to find a low band signal like the local fire channel or your own cordless phone. Extend the antenna and then collapse only the top 2 sections. You'll have to experiment a bit to see where you find your best gains.

Perhaps you'll need to push in the 3rd section half way, it'll depend on the freq involved. I could hear more cordless activity when I used the antenna this way, at least when it was legal to monitor cordless.

The VHF can be helped the same way. But this time you need to collapse elements 4 and 5 down to the coil's top. I find it helps get the best VHF signal in the federal band.

I have also added winding to the coil for better low band reception. I can't explain why the antenna works like it does, we'll leave that for the "techies" as you called them. I did write to Radio Shack about it and one of the engineers responded. But he only offered the info that it was designed using usual antenna theory and spectrum analyser procedures.

It's a favorite when I have the room for it in my gear bag. I hope some of the above info helps you choose a replacement antenna. Someone who lab tested the 43's duck agreed that the 200's was a better choice overall.

Regards,
LGS

They offer numerous VHF style antennas. I've had a couple "cut" to specifc freq's and they seem to perform well. I believe it's the EXS line that you'd want, about 3 1/2" long and they offer a fully jacketed antenna,

i.e., they metal BNC connector is also covered by the rubber jacket. It looks neater and fits snugly on your scanner.

A UHF model I like is Style G model. It's a 1/2 wave and offers 2.5db gain over a standard 1/4 wave antenna. It's base loaded and is about 13" long. If that's too long they also offer a 1/4 wave model called the EXC. I have one cut to a local very low power simplex freq and it really pulls in the signal better than any of my other antennas. About 6" long.

The best antenna overall for my PRO-43 is the EXG which covers the 806-960MHz band. It offers 3.0db gain in a 5/8 wave design, base loaded. Anyone who owns a 200XLT knows it's a brick when it comes to monitoring the 800 trunk band and anything in the 806-960 band. This antenna makes the 200 hear, that's pretty damn good. It measures 8", I keep a spare in my glove box. It's a dynamite antenna.

One advantage to the EXG is that it attenuates the VHF band somewhat. But I find that that's perfect on my PRO-43 which is intermod prone in the VHF band where it's much more sensitive than the 200XLT. This allows me to use it when I'm in a high RF area, especially near pager sites, which are everywhere.

If you want a duck and want only one, the EXG is it. If you want several I'd order a Centurion. They cost $18-24 each. You can also find ducks at flea markets. You'll have better success in ordering a duck cut to the particular freq you want though.

Again, let me know if the previous post got through and if you want, E-mail me about the Centurion line and I'll answer your questions as best as I can.

BTW, an antenna cut to a particular band works very well on a frequency counter by helping it become more sensitive to the band you want to capture a signal from. My Interceptor also likes tuned antennas which help make it less sensitive to TV and radio station RF.

20-006 tuning:

Tuning the 20-006 is simply a matter of experimenting with the antenna by collapsing various sections. Here's one way I found to make it work better on low band and VHF high.

The antenna consists of 5 sections on top of a center loading coil and then 4 more sections under the coil. Section 1 is the top element and #9 is the bottom one for this discourse

Try to find a low band signal like the local fire channel or your own cordless phone. Extend the antenna and then collapse only the top 2 sections. You'll have to experiment a bit to see where you find your best gains.

Perhaps you'll need to push in the 3rd section half way, it'll depend on the freq involved. I could hear more cordless activity when I used the antenna this way, at least when it was legal to monitor cordless.

The VHF can be helped the same way. But this time you need to collapse elements 4 and 5 down to the coil's top. I find it helps get the best VHF signal in the federal band.

I have also added winding to the coil for better low band reception. I can't explain why the antenna works like it does, we'll leave that for the "techies" as you called them. I did write to Radio Shack about it and one of the engineers responded. But he only offered the info that it was designed using usual antenna theory and spectrum analyser procedures.

It's a favorite when I have the room for it in my gear bag. I hope some of the above info helps you choose a replacement antenna. Someone who lab tested the 43's duck agreed that the 200's was a better choice overall.

Regards,
LGS

Well, see a conventional system would be a little more difficult to jam because you'd have to zap quite a few channels with lots of power to make everything unintelligable. To zap a trunked system you need to go after the data channel and do a little bit of creative jamming not necessarily brute force (though it helps). Take it out and who knows what will happen. The above explaination of failsoft is a great one but who says it'll go to failsoft? PDX's went down numerous times and never once did failsoft kick in. I've never heard of them intentionally putting it into failsoft but they may have. I wouldn't bad mouth trunked systems so much if they A) worked as advertised B) weren't so damn much money C) Motorola didn't charge an extra X million dollars to "fix the bugs" and D) sold them to agencies that don't need it. As for being hard to monitor I'd say thats a misnomer, PDX's is no more difficult than the UHF system though there is a bit more traffic to weed through. Instead of making things more difficult for scannists, they've made things more difficult for the agencies that buy them.

someone else.

[..]

Okay, done. Now:

>Don't overlook the Shack's collapsible center-loaded 20-006 antenna. It is
>an excellent choice. You can "tune" it to the band you wish to monitor and

Have you ever heard of one coming apart? In between the segment that is
fixed to the coil and the segments below it (this is all below the coil),
it has completely disassembled itself. I tried to fix it, but it's
hopeless; I'm going to have to pick up another one when I go in to pick
up my '43 (which is in the local InterTAN hospital for some EWP work). I
was just wondering if the 20-006 has a routine of such disintegration.

Civilian GPS is accurate to within a few yards (if not better) and
military
is so accurate that they use it for missile guidance. Civilian and
Military
use the same source, but the source sends "dirty data" or "fuzzy data"
and
the military equipment filters out the "fuzzy data".

I'm by no means an expert with GPS, this is just from my own experience
and
from talking to other's who ARE experts.

Hi,

I have the following problem; I want to buy an AR8000 scanner and nowhere
in the Netherlands can I get one!!

I have asked the same question to about 10 different shops and not a single
one of them is able to deliver one. The problem seems to be the CE certificate.
Therefor I have the following questions:

- Does anybody know if this is true?
- What is the e-mail or web address of AOR?
- Do the scanners that are sold in the UK have the CE certificate?
- Does anybody know an address in the Netherlands where they do sell the AR8000?

Any help would be appreciated,

Patrick van de Steeg.

> WB4SQI

Back when I worked for the Radio Freq service finding TV interference &
the like, if we wanted to reject a signal, we got a T connector,
connected
one end to the antenna, and the other to a 1/4 wave of open circuit
coax(at
the interference freq).
That sucked out the unwanted frequency- at least thats the only way I
could
explain it.
I think this is correct, but it was a long time ago

It seems that this thread needs someone FROM Los Angeles to straighten this out.

Yes, the show was, indeed, called "Adam 12".

There is no "P" designation in the LAPD.

"A" = two-man patrol unit, as in "1A12"
"L" = one-man patrol unit, as in "1L14"

Yes, the "1" prefix does indicate the division, in this case it was "Central" division of LAPD. The "A" was two-man patrol and the "12" was the unit number.

I've listened to LAPD since 1973 and I HAVE heard calls to "1 Adam 11", but never to "12".

I get the best all around reception including AM on all of my handheld
scanners with the Diamond RH77-CA.. it goes for about $30.00 U.S. and
is well worth the money. It even is cut to transmit on 2 meter and 440.

It should be interesting when it is complete.

1357. Frequency Guides - Alternatives to Police Call

Newsgroup: rec.radio.scanner
Date: 1996-08-14 00:00:00 UTC
From: dber@tiac.com
Message-ID: <3211bd45.916736@news.tiac.net>
Source record: 226605

Hello,

I have spent the better part of the last year scanning in my local area. I started with the Beyond Police Call 1996 edition as my basic frequency guide and it seemed fine, however I thought the content was a bit sparse. The descriptions of my town and surrounding towns was quite terse. There was no fire frequency listed for my town --- instead it directed me to a nearby town to look for the frequency. Also, I didn't care for the business listings in a separate section. Anyway, I thought this was my only choice here in Mass, but I found that there were at least two other very fine publications - The Official Massachusetts Frequency Guide and Scanner Master Massachusetts 5th Ed. IMHO, both are superior to the Police Call in content and layout. The Scanner Master book is the best of the lot with clear explanations of what the main frequencies for each town are used for. A large amount of detail on Boston channel systems. Good sections on media, special events in the area (Boston Marathon), etc. The maps in this book are also fine in detail and give an idea as to where the areas are for coverage of a particular police/fire channel in the covered metro area.

So... It turns out that the Scanner Master guides are only published for a few states and it appears that the "Official Frequency" guides are only published for the New England area. I was wondering if there were better alternatives to the Police Call in other parts of the country? Any comments about frequency guides that you use would be enlightening...

Thanks in advance,

Dave Bernazzani

I Agree. This querry is often made in our small town. We have two volunteer fire departments and ambulance services. The local PD has some emergency response medical equipment on board their cruisers. Our E-911 is located at the FD with a secondary PSAP at the PD. The request is usually made from a PD officer in the field who missed the call on their scanner. Sounds to be like the orinial response was from a dispatcher who was on for a double shift and getting a little off focus.

Go back to Radio Shack and ask them to order you a replacement antenna for
the PRO-34 (ThIRTY FOUR). This is the GRE all-band (available direct, too)
which has a much more uniform response across the scanner bands.

last changed June 3, 1996

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

TABLE 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Comments
Radio Shack PRO-24	R35 33K	replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K	try 220K.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase

most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the
scanner or require more detailed information, like series or
parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews of these scanner models
in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT

Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jul 1996 - Uniden/Bearcat BCT-10 mobile

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but

too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal

frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are

backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems.

See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage

in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except

aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage

from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE.

1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2040: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for | modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass,

in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1984 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

TABLE 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner

crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio

operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central | time. For a brochure, send SASE.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1996 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges. The phone number for repair is also (800)297-1023.

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the

frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies. The 1996 edition contains selected business frequencies, too, but callsigns are listed only for local government and public safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed

full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350

Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM | central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined

the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. The RCMA Scanner Journal is no longer being published. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Another club which prints sensitive federal frequencies is * the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters.

Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's

worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

HAMFEST/COMPUTERFEST CALENDAR 1996 - NORTHERN ILLINOIS
last updated June 24, 1996

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (708)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale and ARRL for providing some of the information.

AUGUST

August 4 (Sunday) - Peotone, IL - Hamfesters Radio Club 62nd annual Hamfest and Computer Festival. Will County Fair-grounds, Peotone, IL I-57 Exit 327 East 6a.m. - 3 p.m. Air conditioned main exhibition hall opens 8 a.m. Lots of covered flea marked space, acres of free parking. Grand prize $500, 2nd Prize $300, $100 for 3rd Advance double-stub tickets $4.00, $5.00 at gate for more info e-mail Jim Riley KB9CYL at rileytrix@aol.com

August 10 (Saturday) - Western Illinois ARC Swapfest, Quincy, IL. Eagles Alps Grounds 3737 North 5 th Street. 4.5 miles north of downtown Quincy with easy access from US Highway 24. 8:00 a.m. to 2:00 p.m. Admission is $3.00 at the gate, $2.50 in advance, per person. ARRL VEC testing, all classes, is at 12:30 p.m. Reservations go to NA9Q at (217)224-8526. Indoor flea market is $5.00 per 5-ft table. Outdoor tailgating space is free. Talk-in is on 147.03. Lunch will be served on the grounds.

August 18 (Sun) - DuPage ARC, Stickney, IL. DuPage ARC Ham-fest Computer Show. Hawthorne Race Course, 3500 S. Cicero Ave. Air conditioned exhibit hall for dealers. Outdoor fleamarket spaces free. 8AM - 2PM. 6 AM setup. Admission $5. Kids under 12 free. Talk in 145.25 MHz. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517. tel: 708-985-9256.

August 25 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. Admission $5 at gate, free parking. Kids under 12 free. Info (voice/fax) (708)658-1678.

August 25 (Sun) - Vermilion County ARA, Danville, IL. Info: Gary Denison, KA9SKS, 14704 East 2750 North Rd., Danville,

IL 61834-5610. tel: 217-759-7389.

August 28 - 30 - Antique Radio Club of Illinois, Elgin, IL. RadioFest96. Holiday Inn Holidome and Convention Center, 345 River Road, Elgin, IL 60123 Ph. (708)695-5000, (847)695-5000 After 01/20/96. Info: Jeff Aulik, 1708 Parkview Ave., Rockford, IL 61107 or Carolyn Knipfel, RR 3, 200 Langhorn, Morton, IL 61550.

SEPTEMBER

September 8 (Sun) - Bolingbrook ARS, Joliet, IL. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517, tel: 708-759-7005

September 13-15 (Fri, Sat, Sun) - Peoria, IL. ARRL National Convention. Info: Ron Morgan, KB9NW, PO Box 3508, Peoria, IL 61612-3508, tel: 309-694-2649

Sep 21 & 22 (Sat & Sun), Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. Starts 6 AM. Buildings open 8 AM. VEC testing. Info, (708)457-0966. Usually one of the best hamfests in NE IL.

Sep 29 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

NOTES - Computer Central shows

Computer Central computer shows are held at the College of DuPAGE, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, airplanes, armored cars, trains, taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air

Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and

the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company | which repairs scanners: |

- G & G Communications (telephone 716-768-8151) - This * family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees,

listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club(TSC)isthenameofabimonthlymagazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information

Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM | central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to

use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio | Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. The RCMA's monthly Scanner Journal is no longer being published. The RCMA web page is at http://comp.uark.edu/~plaws/rcma/. The RCMA electronic mail address is RCMAHQ@GEnie.com. *

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association

(RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling | (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

BUT, MicroSoft Works DOES have a Communications program that allows
you to transfer information from it's programs to the twisted pair.
Bill, there may be some folks out there that are unfamiliar with
Works. It is what is called a "utility" program, because it has a
Word Processor, Spread Sheet and Database program combined with the
communications program. They are, of course highly compatable with
each other, and all together, make up a program that is outstanding. I
have used it since 1987, and it is almost intuitively easy to use.
I wouldn't use anything else. :-}

1377. FS:Yupiteru Continuous coverage scanner

Newsgroup: rec.radio.scanner
Date: 1996-08-14 00:00:00 UTC
From: bgluck@monmouth.com
Message-ID: <4ut703$ro2@news.monmouth.com>
Source record: 226625

I have an excellent condition, continuous coverage, Yupiteru MVT-7100 hand held scanner for sale. Frequency coverage is continuous from 100 Khz to 1650 Mhz(including cellular freqs.). It has 1000 memory channels, wideband FM, narrowband FM, AM, LSB and USB modes. Many other features. This is one of the best hand helds on the market. It comes with two different operating manuals, ac adapter, rechargeable batteries, carrying strap, and belt clip. The unit can also run on 4 AA batteries in a pinch.

It is for sale at $425 + shipping or I would
trade for an interesting short wave receiver or other radio related items.

Email for more info.

Thanks, Barry Gluck, WA2KLS

1378. Re: Funniest Dispatches

Newsgroup: rec.radio.scanner
Date: 1996-08-14 00:00:00 UTC
From: D.Gray@AutoComm.cityscape.co.uk
Message-ID: <840048581.1041.1@cisas91.demon.co.uk>
Source record: 226626

We run commercial 2 way radio communications networks here in the UK

We operate a strict rule about bad language on air. Our dispatshers have instructions to cut off any one swearing or using foul language, ask them to moderate their language and then reconnect them through our repeaters. We only have to do this once or twice a year as most of the users also use smart proceedures.

One day however, a driver came on air with the foulest language anyone could use. The dispatchers were unable to cut him off due to their laughing!

The driver operated a "Sludge Gulper" and was in the process of emptying a full (human) sewage tank in mid-summer. During the process a pipe burst spraying him, his vehicle and the surrounding area with the brown liquid contents of the tank.

His description of what was happening was something to be heard... I can't even begin to detail it all but it went something like:-

"The F..cking shit pipe has burst - I'm covered in it! My f..cking sandwiched are buggered, covered in it. The cab is full of the f..cking stuff. It's all over the f..cking place. It F..cking stinks .... I can't stop the f..cking thing from spraying it evey f..cking where....Oh F..ing shit!"

The dispatcher decided NOT to chide him !

>the air.

A few years back CB was illegal un the UK. Some enthusiasts started importing US AM & SSB models.. Very soon, any boy racer worth his bulge sported a CB aerial and talked the lingo, good buddy.

The upshot was that there was a massive increase of illegat & high powered rigs being used here.

Legislation was bought in to permit CB but using FM only. AM & SSB were not allowed.....

I was listening on the illegal AM channels one night and actually heard the following statement from a so called expert CBer advising a youngster:-

" I hope that they make AM legal 'cos this FM stuff doesn't travel so far and has no skip. FM modulation wobbles sideways and bounces off the walls of the buildings and soon looses power but AM wobbles up and down so it jumps over the buildings into the sky and gets much further!"

==========
BTW: The little balls on the top af antennas:-

1) IF they are about a quarter inch in diameter, then they are purely a safety device to stop injury to the person.

2) IF they are half inch or larger, then they are probably a "Capacity Hat" to help tune or make the antenna more broad banded.

3) The balls ARE NOT anti-static devices!

What ever, its all a load of balls!

We already complain that 90% of the posts are crossposted to both rec.radio.scanner and alt.radio.scanner; if we had a third group, most messages would be posted to all three! What we need to do is agree that one of our two existing usegroups be used only for frequency exchange and the other never be used for frequency exchanges.
I wasn't the one who originally sugested spliting the two this way but, when the sugestion was posted it generated only two responces (and one of those was from someone who didn't know that their is an alt.radio.scanner), so good luck at getting anything like that done!

>
> In my opinion these are ALL valid common scanner questions,

Yup.

I'd think twice about the "What's the best.." questions, though.
"Best" can mean different things to different people; we all scan for
different reasons. Plus the answers to these questions are likely
to be pretty subjective and are likely to get out of date quickly.
Is there a consensus on what the best scanner is today w/o discussion?

The alternative might be to phrase the questions as "What sort of
choices do I have for...". The answer can consist of some of the
more popular alternatives discussed here with pros/cons. The
reader can look for what fits his needs. Additionally, a simple
list probably won't get out of date as quickly. The "What's the
best..." question would have to be revisited every time something
new came out, instead of just adding the new product info to the list.

Suggestions for specific additions:

What are images and how do they affect my scanning?
What are birdies and how do they affect my scanning?

With the multi-channel radios used by FBI, DEA, SS etc., are there certain channels or frequencies that are automatically, or always encrypted? Or does the operator have a choice by throwing a switch to transmit encrypted or in the clear? Sometimes I'll hear one agent tell another to "go to ch. 10", then I'll hear static on another freq. I guess I want to know if that channel is always encrypted by design. Other times, of course, I'll hear a coded trans. followed by the info from a plate lookup by the base in the clear. So it was obvious that the coded trans. was asking for that info in encrypted mode, but the response on that same freq. was in the clear. Does this make any sense? Any thoughts or ideas?
Thanks,
Phil

>
>Communications failure does not necessarily require complete equipment
>failure...

The number of users on the 5 repeaters in your example doesn't change.
The protocols for using the system would probably change. The central
controller is nothing more than a traffic cop for the system that gives
users the "feel" of having their own channels. If the traffic signals go
out at an intersection, it becomes a four way stop in most cases -
drivers deal with it but the intersection is not necesaarily impassable.
The same goes for radio channels.

If this was a major disaster, many of the non-emergency users are told to
keep traffic to an absolute minimum...unless you need a code-3 garbage
truck somehwere <g>. Even when the system is working properly, if it
gets busy, lower priority traffic has to wait in queue.

Trunked radio fleets and subfleets are organized with failsoft situations
in mind. 500 units can still use a 5 channel system in a conventional
configuration - you just hear more traffic. The number of people using
those channels doesn't change. The number of users on a channel just
increases.

We have a system that we intentionally put into fail-soft for exercise
purposes every once in a while. People then know how the system behaves
and who they have to share channels with the system goes dumb.

I am curious about this thread. What do you think users of conventional
systems do when there is a major failure somewhere? Or is there an
underlying agenda here?...Such as, "Here's another reason to bad mouth
systems that are hard for us scanner buffs to monitor."

Curtis

Hi, saw the post about your PRO-43 antenna and I have some info to share. I tried to E-mail & post a reply yesterday but it looks like something went wrong and it never made it to the newsgroup. Let me know if you got the E-mail.

The 200XLT antenna is a better replacement. I was told the Radio Shack PRO-34 antenna is the same as the 200's. I've used both and they both work better overall. I see someone has already mentioned the PRO-34 antenna.

Don't overlook the Shack's collapsible center-loaded 20-006 antenna. It is an excellent choice. You can "tune" it to the band you wish to monitor and it will cost a lot less than buying a new duck. I'll talk about tuning it after I talk about the duck antennas.

Another choice was the RS 32" collapsible. I don't see it in the catalog but I have one and it works very well, better low band performance.

If you really want a collection of ducks, I would recommend the Centurion line of antennas. a couple of years back they would sell direct to an individual like you and me but they've stopped the practice.

I found a distributor locally but when I asked if they'd like their name posted they declined. Centurion had problems collecting money from individual accounts I was told, and I suspect this is why my distributor doesn't want to advertise to the scannists.

However, you can look for a distributor in your area. You can use the phone book or Alta Vista on your computer. Look under two-way radios, radios, antennas, etc... you'll narrow it down pretty easy.

You might wish to call Centurion and ask them for a catalog and the name of a distributor near to you. The number is 1-800-228-4563.

I'll list the Centurion antennas I use. If you have any questions, E-mail me and I can get into more detail, I have their latest catalog.

The best low band antenna is their EXL model. It covers 30-50MHz and is available in bands of 30-36, 36-42, 42-50MHz. It is a bit long at 11".

The best dual band they offer for VHF/UHF is the EXY model. It covers the 140-174 and 400-512 bands. It's about 6" length but can be reduced to 5 1/4" by trimming the PVC jacket.

They offer numerous VHF style antennas. I've had a couple "cut" to specifc freq's and they seem to perform well. I believe it's the EXS line that you'd want, about 3 1/2" long and they offer a fully jacketed antenna,

i.e., they metal BNC connector is also covered by the rubber jacket. It looks neater and fits snugly on your scanner.

A UHF model I like is Style G model. It's a 1/2 wave and offers 2.5db gain over a standard 1/4 wave antenna. It's base loaded and is about 13" long. If that's too long they also offer a 1/4 wave model called the EXC. I have one cut to a local very low power simplex freq and it really pulls in the signal better than any of my other antennas. About 6" long.

The best antenna overall for my PRO-43 is the EXG which covers the 806-960MHz band. It offers 3.0db gain in a 5/8 wave design, base loaded. Anyone who owns a 200XLT knows it's a brick when it comes to monitoring the 800 trunk band and anything in the 806-960 band. This antenna makes the 200 hear, that's pretty damn good. It measures 8", I keep a spare in my glove box. It's a dynamite antenna.

One advantage to the EXG is that it attenuates the VHF band somewhat. But I find that that's perfect on my PRO-43 which is intermod prone in the VHF band where it's much more sensitive than the 200XLT. This allows me to use it when I'm in a high RF area, especially near pager sites, which are everywhere.

If you want a duck and want only one, the EXG is it. If you want several I'd order a Centurion. They cost $18-24 each. You can also find ducks at flea markets. You'll have better success in ordering a duck cut to the particular freq you want though.

Again, let me know if the previous post got through and if you want, E-mail me about the Centurion line and I'll answer your questions as best as I can.

BTW, an antenna cut to a particular band works very well on a frequency counter by helping it become more sensitive to the band you want to capture a signal from. My Interceptor also likes tuned antennas which help make it less sensitive to TV and radio station RF.

20-006 tuning:

Tuning the 20-006 is simply a matter of experimenting with the antenna by collapsing various sections. Here's one way I found to make it work better on low band and VHF high.

The antenna consists of 5 sections on top of a center loading coil and then 4 more sections under the coil. Section 1 is the top element and #9 is the bottom one for this discourse

Try to find a low band signal like the local fire channel or your own cordless phone. Extend the antenna and then collapse only the top 2 sections. You'll have to experiment a bit to see where you find your best gains.

Perhaps you'll need to push in the 3rd section half way, it'll depend on the freq involved. I could hear more cordless activity when I used the antenna this way, at least when it was legal to monitor cordless.

The VHF can be helped the same way. But this time you need to collapse elements 4 and 5 down to the coil's top. I find it helps get the best VHF signal in the federal band.

I have also added winding to the coil for better low band reception. I can't explain why the antenna works like it does, we'll leave that for the "techies" as you called them. I did write to Radio Shack about it and one of the engineers responded. But he only offered the info that it was designed using usual antenna theory and spectrum analyser procedures.

It's a favorite when I have the room for it in my gear bag. I hope some of the above info helps you choose a replacement antenna. Someone who lab tested the 43's duck agreed that the 200's was a better choice overall.

Regards,
LGS

If that's too long they also offer a 1/4 wave model called the EXC. I have one cut to a local very low power simplex freq and it really pulls in the signal better than any of my other antennas. About 6" long.

The best antenna overall for my PRO-43 is the EXG which covers the 806-960MHz band. It offers 3.0db gain in a 5/8 wave design, base loaded. Anyone who owns a 200XLT knows it's a brick when it comes to monitoring the 800 trunk band and anything in the 806-960 band. This antenna makes the 200 hear, that's pretty damn good. It measures 8", I keep a spare in my glove box. It's a dynamite antenna.

One advantage to the EXG is that it attenuates the VHF band somewhat. But I find that that's perfect on my PRO-43 which is intermod prone in the VHF band where it's much more sensitive than the 200XLT. This allows me to use it when I'm in a high RF area, especially near pager sites, which are everywhere.

If you want a duck and want only one, the EXG is it. If you want several I'd order a Centurion. They cost $18-24 each. You can also find ducks at flea markets. You'll have better success in ordering a duck cut to the particular freq you want though.

Again, let me know if the previous post got through and if you want, E-mail me about the Centurion line and I'll answer your questions as best as I can.

BTW, an antenna cut to a particular band works very well on a frequency counter by helping it become more sensitive to the band you want to capture a signal from. My Interceptor also likes tuned antennas which help make it less sensitive to TV and radio station RF.

20-006 tuning:

Tuning the 20-006 is simply a matter of experimenting with the antenna by collapsing various sections. Here's one way I found to make it work better on low band and VHF high.

The antenna consists of 5 sections on top of a center loading coil and then 4 more sections under the coil. Section 1 is the top element and #9 is the bottom one for this discourse

Try to find a low band signal like the local fire channel or your own cordless phone. Extend the antenna and then collapse only the top 2 sections. You'll have to experiment a bit to see where you find your best gains.

Perhaps you'll need to push in the 3rd section half way, it'll depend on the freq involved. I could hear more cordless activity when I used the antenna this way, at least when it was legal to monitor cordless.

The VHF can be helped the same way. But this time you need to collapse elements 4 and 5 down to the coil's top. I find it helps get the best VHF signal in the federal band.

I have also added winding to the coil for better low band reception. I can't explain why the antenna works like it does, we'll leave that for the "techies" as you called them. I did write to Radio Shack about it and one of the engineers responded. But he only offered the info that it was designed using usual antenna theory and spectrum analyser procedures.

It's a favorite when I have the room for it in my gear bag. I hope some of the above info helps you choose a replacement antenna. Someone who lab tested the 43's duck agreed that the 200's was a better choice overall.

Regards,
LGS

I think the TV series used the L number for
supervisors. There was also the occasional "Mary" unit on a
motorcycle.

>I've listened to LAPD since 1973 and I HAVE heard calls to "1 Adam 11",
>but never to "12".

The producers and their police consultants probably
selected 1A12 because it was outside the series of numbers
in actual use.

The New York State Police also have a unit 1A-12,
but the call is pronounced as, "One A One Two," the same as
all other NYSP car numbers.

Pretty amaturish attempt, wouldn't you say?

I'm sure that both Oracle, barrnet, and biosys.apldbio would love to know that you are posting this kind of flaming junk through their systems.

There are at least two web pages available with this
information:

www.frontiernet.net/~dstark/ The NF2G Scannist Pages

www.iaw.on.ca/~sstdenis/ The Fort Erie, Ontario Scanner
Radio Frequency Database

Each of those pages has links to other locations
with Canadian frequencies.

:: decent 1000 Watt Xmitter and apply a bunch of noise or micro bursts to
:: the control channels data stream and *poof*, trunked radio failure.
:
:That's too complicated for many terrorists, also not 100% effective.
:Easiest way: find the microwave tower located at the main controller site
:(in many cities, this is located at the communications center[s], separate
:from all the transmitters. Blow up said microwave tower. Not only are the
:data controllers out of the picture for an indefinite period, but the comm
:center gets no radio signals in or out, leaving the units on the street
:high and dry.
:
:Kind of scary when you think about it. Reliance on high-tech
:communications systems definitely has it's drawbacks.
:
:Tom Swisher, N8GQK

I was under the impression the most of the trunked systems have some sort
of fallback, default mode that would allow communications to continue at a
reduced level.

>(DS) and it's encrypted. If you can crack it, call NSA and apply for a job.
>Tropez also has phones that are Digital Spread SPectrum (Freq Hop) and
>I've seen them as low as $99.

Just to make a few points clearer for you...

Digital Spread Spectrum is technically not the same as encryption. I
do believe the phone you refer to is Digital and Spread Spectrum, but
not necessarily encrypted.

Also, Digital Spread Spectrum (no encryption) has been cracked
successfully. I doubt it was a real low budget venture using a Rat
Shack scanner, but I do believe it has been done. I've talked to some
Tech Surveillance folks who don't seem top troubled by the devices.

Finally, Digital Spread Spectrum is not the same as frequency hopping.

Just FYI...

>What is the Ball for on the tip of my antenna?

Nope, you guys have got it all wrong. I heard this at a local ham radio dealer back in the mid 70's.

CB'er is trying to find a replacement for the little ball on the end of his antenna. Salesman (a licensed HAM operator) tries to explain that it isn't necessary for the antenna to work properly. CB'er says he has to have it because the radio waves run up the antenna, hit the ball and spread out and without it they would just go straight up into the air.
